Foreword

- The purpose of this document is to describe the features of the Agriculture and Agri-Food Canada (AAFC) Medium Term Outlook for the international and national agricultural markets covering the 2010 to 2020 period. The outlook is an attempt to outline a plausible future of the international and domestic agri-food sectors. It serves as a benchmark for discussion and scenario analysis.
- The outlook makes specific assumptions and outlines their implications. Since it assumes that policies remain unchanged from existing legislation, the outlook is not necessarily a forecast of future events. In particular there are no assumptions made regarding the outcome of the Doha round of trade negotiations and of possible future bilateral trade agreements. It also assumes no impact from climate change and from policy to mitigate climate change, nor significant animal disease outbreaks or unusual weather conditions over the period of the outlook. Finally, in the absence of a final WTO decision on the Mandatory Country of Origin Labeling (MCOOL), policies currently in place are maintained throughout the baseline.
- The international outlook was produced with the 2009 version of the AGLINK/COSIMO model of the Organization for Economic Cooperation and Development (OECD) and of the Food and Agriculture Organization (FAO) and the national outlook with the AAFC Food, and Agriculture Regional Model (FARM).
- The evolution of the world crude oil price reflects mostly the outlook indicated by Natural Resources Canada in the fall of 2010. The macro-economic forecasts released by the OECD in September 2009 and by the World Bank in June 2009 were adjusted using more current information. Exchange rates were updated to reflect the information available as of September 2010. The agricultural outlook reflects short term price forecasts produced and released by the U.S. Department of Agriculture (USDA) in October 2010.
- The Canadian macro-economic forecasts for 2010 to 2015 are from the Conference Board of Canada outlook published in September 2010. The yearly growth rate in 2015 was maintained for each year of the period 2016 to 2020 for each macro-economic variables used in FARM.

Summary of the international markets

- The OECD as a group is recovering very slowly from the recession with an average growth rate of only 1.7% in 2010. For the rest of the outlook an average annual growth rate of 2.6% is expected. The BRIC (Brazil, Russia, India and China) countries are still growing at rapid rate with an average of 7.6% in 2010 and an annual mean of 6.8% over the remaining years. The average growth rate of the other key countries is 3.6% in 2010 and 4.6% on average for the rest of the outlook period.
- Except for the euro, all other major currencies experienced a significant appreciation in real terms against the U.S. dollar in 2010. Considering the structural budget deficits and negative trade balance, the U.S. dollar is assumed to weaken in real terms against many currencies over the next 10 years.
- Oil prices are anticipated to increase by 30% in real terms compared to the 2008-2010 period. This will contribute to maintaining a strong Canadian dollar.
- As the ethanol industry in Brazil and the U.S. are moving toward flex-fuel cars the ethanol/gasoline price ratios will fall closer to their relative energy value.
- The world price of sugar should fall back to a more reasonable level but remain above the values recorded at the beginning of the century because of the competition for the use of cane from the ethanol industry.

Summary of the international markets (continued)

- In spite of short term fluctuations, the new higher world price plateau for cereals and oilseeds is here to stay. In absence of new weather events, prices should fall from their 2010-11 peaks in the short term.
- The growing biodiesel production resulting from the high crude oil price and the mandates and the additional demand generated from income growth in developing countries led to an increase in the world vegetable oil price in real terms.
- The debate over obesity is leading to a major collapse of the high fructose corn syrup (HFCS) industry in the U.S., freeing some corn for other uses.
- Cattle and hog prices will remain cyclical but will gradually and partially adjust to higher feed prices through a reduction in supply.
- However, because of productivity gains and changes in feeding practices (more short keep and greater use of DDG and wet DG) the livestock/feed price ratios will remain at a new lower plateau.
- Income growth of developing countries, natural resources constraints in Oceania, low export subsidies, export taxes in Argentina, high vegetable oil prices and higher feed costs all contribute to a new higher world price plateau for dairy products. This combined with a weak U.S. dollar led to the full integration of the U.S. butter and SMP industry into the world markets.

Summary of the national crop markets

- The key drivers of the Canadian crop outlook are world prices, the exchange rate and the limited growth of the red meat industry.
- 2010-11 has been very challenging for western Canadian producers due to excessive precipitation, a cold summer and excess soil moisture in most growing areas. As a result a significant portion of the western crop area was not seeded and/or suffered significant damage throughout the crop year yielding a poor harvest in quantity and/or quality. Growing conditions in eastern Canada were generally good in 2010-11.
- For the medium term, prices of grains, oilseeds and special crops are projected to be significantly higher than the period before 2006 in spite of a Canadian dollar at par with the US dollar, albeit price levels are expected to be below the peak of 2007-08. In response, total harvested area is projected to increase compared to the historical average (2005-2009). The largest increase is recorded for oilseeds followed by corn and special crops. Summer fallow area will continue to decline despite its temporary increase in 2010-11.
- Canada remains a net importer of feed grains in the short term because of excess moisture in the prairies. However, Canada returns to a net export position for feed grains in the medium term which will benefit livestock producers.
- Domestic biofuel production will count for a growing share of the targets.
- Canola crushing capacity expands significantly in the short-term and is expected to continue to expand further throughout the medium term, but strong production growth still results in large exports of canola seed. The larger use of canola oil for biodiesel production remains much smaller than the growth in canola oil production, leading to a strong increase in exports.

Summary of the national livestock markets

- Relatively high feed grain prices coupled with the implementation of MCOOL in the U.S. and the strong Canadian dollar affect the competitiveness of the Canadian red meat industry.
- In 2010, the cattle breeding herd reached its lowest level since 1997 and no increase is expected until 2012. As a result, the marketings of cattle are very low in 2012, 2013 and 2014 and start increasing again in 2015. MCOOL exerts more downward pressure on livestock prices than meat prices. As a result, a relatively larger share of cattle is diverted to domestic slaughter.
- The Federal Cull Breeding Swine Program (ended in 2009), the Hog Farm Transition and the Hog Industry Loan Loss Reserve Programs (ended in 2010), coupled with significant changes to the Québec ASRA program and relatively tight margins are all contributing to a lower swine herd in the short term. Although 2010 hog farm prices are significantly above 2009 levels, higher feed cost have kept profit margins relatively low. As a result, slaughter hog marketings will remain low in 2011 and will slightly increase in the medium term while keeping its cyclical pattern. In general the profitability of hog farming will be lower than hog processing partly because of MCOOL and this will lead to lower export of slaughter hogs compared to the historical average.
- Growth in consumption of poultry is expected to be lower with a more mature market. Following a major drop in the price of eggs in the U.S. in 2009, the levy to finance the use of Canadian eggs by the breaker industry increased significantly in 2010, and continues its upward trend over the medium term.
- Total milk production in 2010/11 is expected to be slightly higher than in the previous year. While there is growth in per capita consumption for some dairy products consumption, overall milk fat is stable limiting milk production to the growth in population. The SMP surplus still remains a deteriorating factor in the milk pool price.
- Weather events in 2010 will put upward pressures on food prices in 2011, but much less so compared to 2009, which was also affected by the depreciation of the Canadian dollar. Annual change is expected to average 2% over the medium term.
- High prices of grains and oilseeds will contribute to a strong positive trade balance.

INTERNATIONAL MARKETS

Macroeconomic assumptions

- The world population is expected to grow by slightly more than 1% per year over the period of the outlook. Growth in developing countries is anticipated to be three times higher than in the OECD and, as a result, the OECD's share should fall from 18 to 16% between 2009 and 2020.
- The OECD as a group is recovering very slowly from the recession with an average growth rate of only 1.7% in 2010. For the rest of the outlook an average annual growth rate of 2.6% is expected. The BRIC (Brazil, Russia, India and China) countries are still growing at a rapid rate with an average of 7.6% in 2010 and an annual mean of 6.8% over the remaining years. The average growth rate of the other key countries is 3.6% in 2010 and 4.6% on average for the rest of the outlook period.
- The inflation rate is in general low with an annual average of 2.1, 4.1 and 5.3% respectively for OECD, BRIC and a group of other key countries.
- The U.S. dollar depreciated in real terms against major currencies in 2010 with the exception of the euro (see next slide). Over the longer term it will continue to depreciate in real terms against the currencies of Argentina, Brazil, Mexico, China, Korea, Indonesia, India, Ukraine and Russia. It will be stable or almost stable against the currencies of Canada, Thailand, Australia, New Zealand and the European union while it will appreciate against the Japanese yen (which is very strong presently) and the south African rand.
- According to Natural Resources Canada, the international price of crude oil should increase by 48% in nominal terms between 2008 and 2030. This represents only a 4% increase in real terms. However compared to the level in 2009 it still represents a large increase and consistent with the idea that the era of cheap energy is over.

Except for the euro, all other major currencies experienced a significant appreciation in real terms against the U.S. dollar in 2010. Considering the structural budget deficits and negative trade balance, the U.S. dollar is assumed to weaken against many currencies

¹Country name abbreviations reflect those used by the United Nations.

Oil prices are anticipated to increase by 30% in real terms compared to the 2008-2010 period. This will contribute to maintaining a strong Canadian dollar

Foreign policies

- The U.S. implemented MCOOL on September 30, 2008. The new U.S. Average Crop Revenue Election (ACRE) program is in operation but the participation rate is low.
- The mandatory 10% set-aside of arable land in the European Union has been eliminated over the entire outlook period. The gradual increase and the elimination of the milk production quota in the European Union is included in the outlook.
- A tax of 35% is imposed on Argentinean oilseed exports for the duration of the outlook.
- Russian grain exports will only be affected by controls in 2010-11.
- China's wheat and rice imports will remain much below their TRQ while oilseed imports will explode and coarse grain imports will reach 4 million tons.
- Mexican direct and Procampo payments are assumed to be stable in real terms.
- The bilateral trade agreement between the U.S. and South Korea is not included.
- U.S. sugar policy remains unchanged.
- The Atlantic and Pacific red meat markets remain segmented.

- It is assumed that all the yearly renewable fuel mandates announced by the U.S. in December 2007 will be at least reached over the outlook period except the cellulosic ethanol mandate. All the other measures will not be modified.
 - ❖ By 2015 the U.S. will be consuming 56.7 billion litres of corn based ethanol. The U.S. will be producing slightly more because Canada will be a net importer.
 - ❖ The filling rate of the cellulosic based ethanol mandate will vary between 15 and 19%. Most of that production will be from crop residues. Ethanol from dedicated biomass like switchgrass will only start to grow after 2012 and will not use a significant amount of cereals and oilseeds area harvested.
 - ❖ The bio-diesel mandate established at 3.78 billion litres will be met by 2012 and consumption will remain at that level thereafter. The mandate will be filled by local production. Tallow and inedible animal fat will never surpass 25% of the feedstock used, the rest will be coming from vegetable oils.
 - ❖ By 2018, 11.3 billion litres of ethanol will also be consumed under the other advanced biofuels mandate. This mandate will mostly be filled by dehydrated Brazilian ethanol imported through the Caribbean and from production of ethanol from non-agricultural feedstock in the U.S.
 - ❖ Prices of other advanced biofuels will be higher than corn based ethanol. It will, however, not be high enough to allow direct imports from Brazil since they will continue to be blocked by the large tariff. The price of cellulosic ethanol will be even higher in spite of technological progress.
- As a result of the announced increase in the maximum level of ethanol (from 10 to 15%) allowed in low blend cars, the amount of ethanol used by these cars will continue to surpass the effective mandates until 2014.
- The European Union fuel ethanol consumption should increase significantly, following the implementation of the new Renewable Energy Directive which calls for a 10% (energy basis) share of renewable energy in the transport fuel mix by 2020. They will only achieve their ethanol objective since bio-diesel will only represent 8% of diesel consumption. In both cases it still represents a large increase in consumption.
- World biofuels production should increase from 86 billion liters in 2008 to 220 in 2020.

As the ethanol industry in Brazil and the U.S. are moving toward flex-fuel car the ethanol/gasoline price ratios fall closer to their relative energy value

The world price of sugar should fall back to a more reasonable level but remain above the values recorded at the beginning of the century because of the competition for the use of cane from the ethanol industry

In spite of short term fluctuations, the new higher world price plateau for cereals is here to stay. In absence of weather events next year, prices should fall from their 2010-11 peaks in the short term

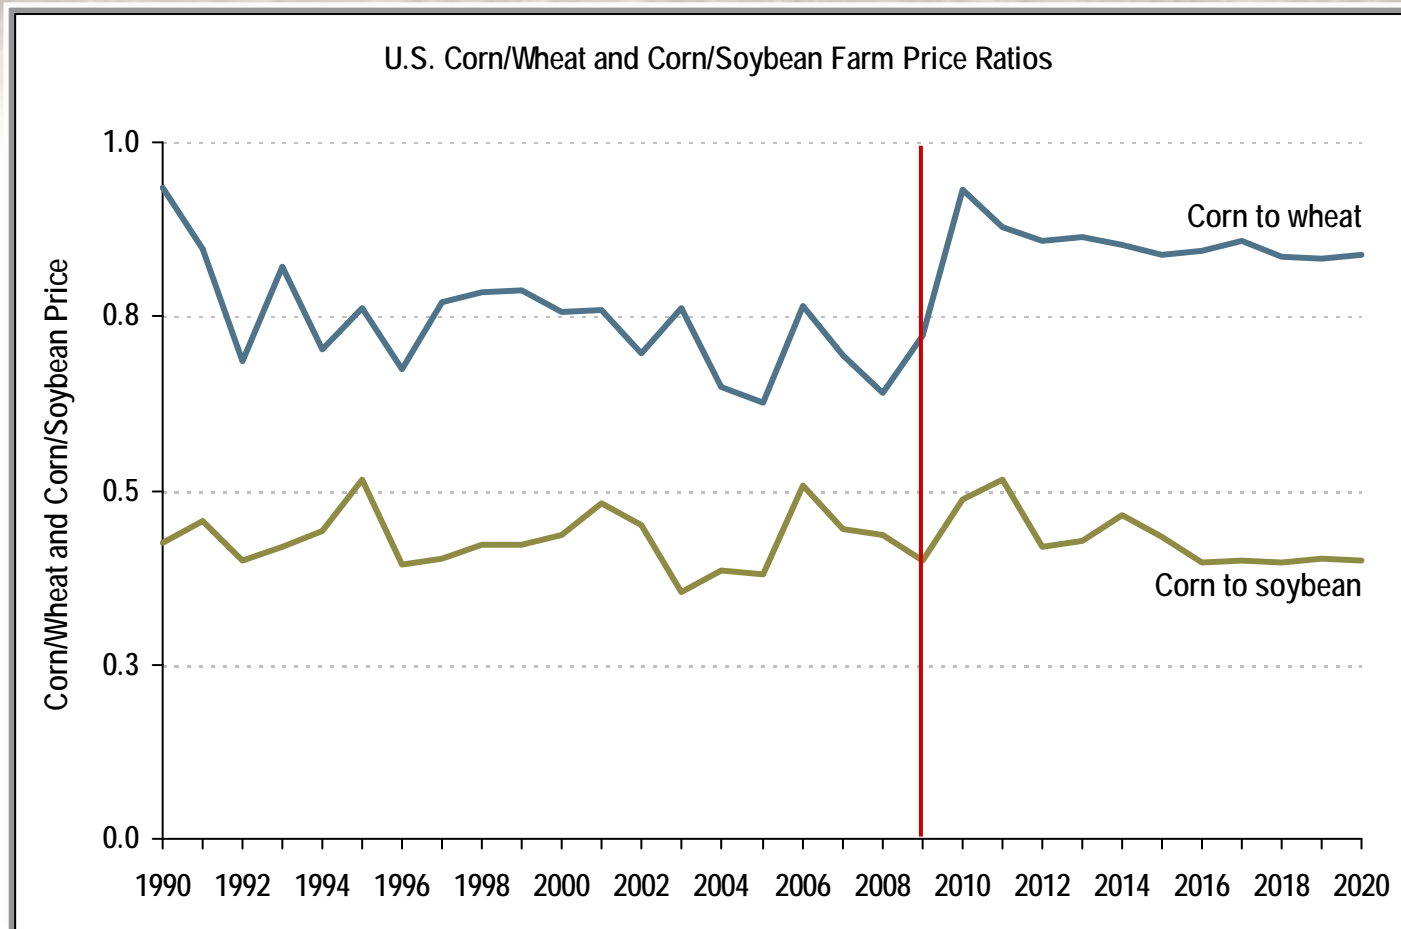

The growing biodiesel production resulting from the high crude oil price and the mandates and the income growth in developing countries should lead to an increase in the world vegetable oil price in real terms. The growth in the price of the joint product, oilseed meal, is much more limited

The increasing demand for vegetable oil and competition for land with corn push soybean prices to record levels. Through competition on both the supply and the demand side, the price of rice will also remain above the level at the beginning of the century

The corn soybean price ratio continues very slowly its downward trend. The anticipated huge increase in crude oil and fertilizer prices combined with large corn based ethanol production creates a structural shift in the corn wheat price ratio

The debate over obesity is leading to a major collapse of the high fructose corn syrup (HFCS) industry in the U.S., freeing some corn for other uses

Livestock prices will remain cyclical but will gradually and partially adjust to higher feed prices through a reduction in supply

However, because of productivity gains and changes in feeding practices (more short keep and greater use of DDG and wet DG) the price ratios will remain at a new lower plateau

Because of productivity gains and changes in feeding practices, the U.S. milk to feed price ratio will remain at a new lower plateau. Productivity gains will lead to similar results for the feather industries

Income growth of developing countries, natural resources constraints in Oceania, low export subsidies, export taxes in Argentina, high vegetable oil prices and higher feed costs all contribute to a new higher world price plateau for dairy products

The high world prices of raw dairy products combined with a weak U.S. dollar should lead to the full integration of this U.S. industry into the world markets

In general, the price of raw dairy products (butter/SMP) will fall relative to cheese and WMP

NATIONAL MARKETS

National assumptions

- The Canadian population is projected to increase by 1.2% per year.
- Yields for grains and oilseeds are generally expected to increase at trend rates.
- It is assumed that Federal regulations requiring an annual average renewable content of 5% in gasoline by 2010 and 2% in diesel fuel and heating oil by 2012 will be implemented.
- The cap on the number of animals covered under the hog stabilization program (ASRA) announced by Quebec in 2010 is included in the Outlook.
- The increases in the price of industrial milk will be equally distributed between the support price of butter and skim milk powder.
- The fat/solids-not-fat ratio for raw milk should be relatively stable as measures implemented by producers are maintained.

National assumptions: Macroeconomic outlook

Domestic crop prices do not increase as much as international prices because of the strong appreciation of the Canadian dollar but remain above pre-2006 levels

High grain and oilseed price plateaus are expected to result in a modest expansion of total area harvested throughout the outlook. Relative prices should lead to larger harvests of canola, soybeans and corn

The growth in feed demand will be mostly met by greater use of coarse grains. Productivity gains in feed conversion are expected to improve modestly

In the short term, the reduction in production resulting from the excess moisture in the prairies is reflected in lower wheat exports. However, in the medium term, strong wheat prices support growth in wheat production, resulting in increased wheat exports in spite of increasing use for ethanol

Domestic biofuel production will count for a growing share of the mandates

The large increase in canola production resulting from a relatively high price will be sufficient to allow significant increase in crushing and exports

Apart from 2010-11 due to the excess moisture in the prairies, Canada should generate a surplus of feed grains which will result in an export price basis and increased competitiveness for Canadian livestock producers

The marketing of slaughter cattle will increase more than the breeding herd because feeder cattle exports will be lower than the historical peak

The expected feed grain surplus will lead to higher exports of slaughter cattle versus feeder cattle. However, the total number of cattle exported remain below historical levels

As domestic beef consumption remains relatively stable, the increase in cattle slaughter and in average weight in the medium term leads to an increase in beef exports

Margins will continue to be cyclical in the hog industry but from a lower base and this will limit growth of total marketings of slaughter hogs and weanlings

MCOOL and the strong Canadian dollar are leading to a large decline in slaughter hog and weanling exports. Because of the feed grain surplus, the share of slaughter hogs will increase compared to the 2009 and 2010 levels

With a 8% drop in 2010, the negative trend in per capita pork consumption continues. This combined to larger production results in higher exports

Growth in poultry consumption is expected to be similar to the previous decade since the market is more mature and poultry prices are expected to increase relative to substitute meats

Following a major increase in the price of eggs in the U.S. in 2008, Canadian authorities were able to substantially reduce the levy in 2009. With a more normal price level in the U.S. in the medium term, the Canadian levy should return to its upward trend

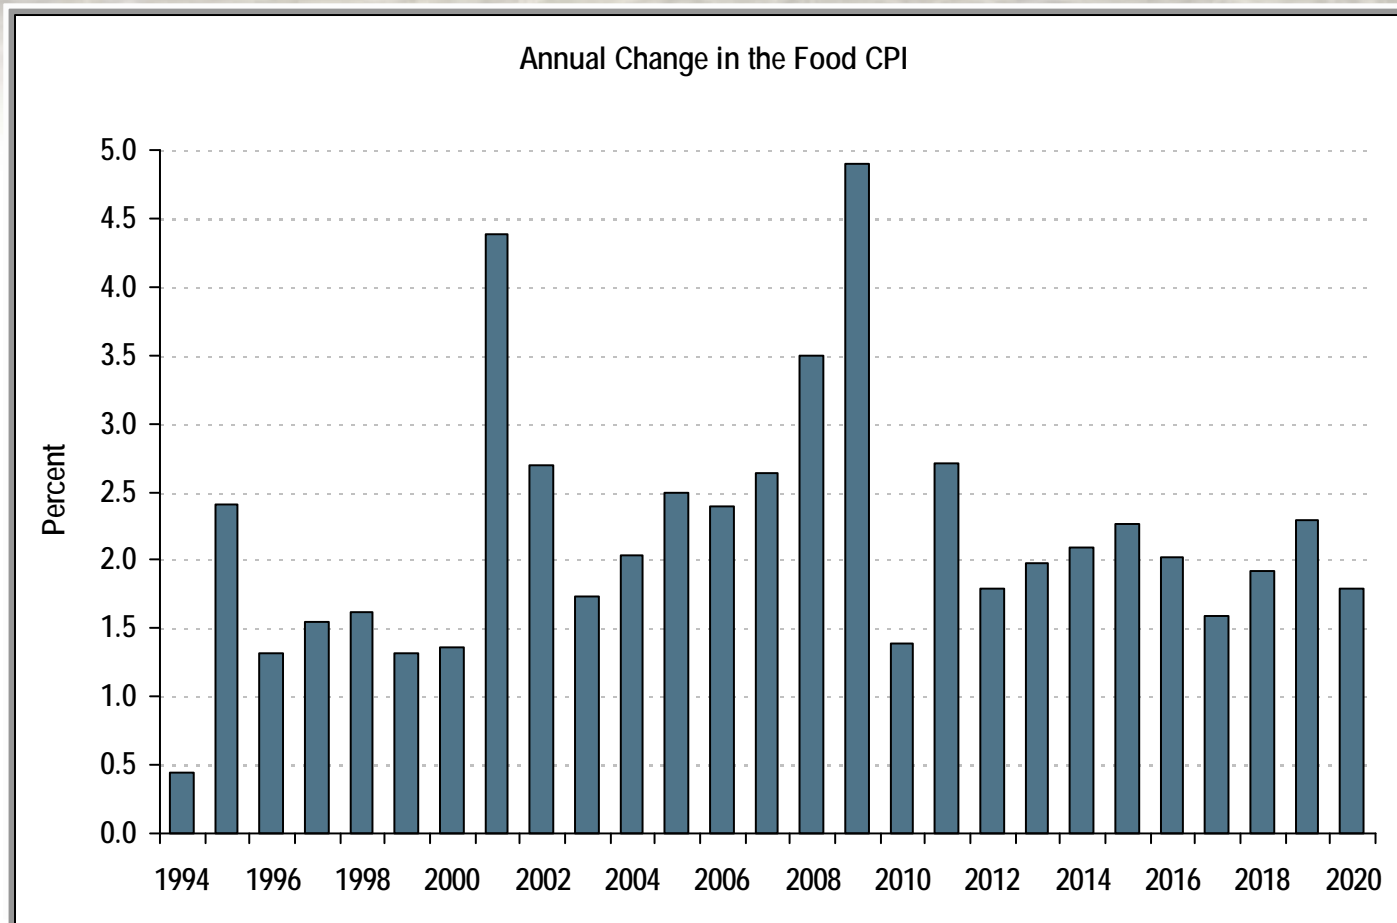

With moderate increases in Canadian prices of dairy products, the tariff should prevent over-quota imports because high world prices will more than offset the impact of a strong Canadian dollar

Since the Canadian dairy market is mature and characterized by an aging population, per capita consumption of all dairy products (except for yogurt) will either continue to fall or increase less rapidly

Weather events in 2010 will put upward pressure on food prices in 2011 but much less so than in 2009, which was also affected by the depreciation of the Canadian dollar. Annual change is expected to average 2% over the medium term

High prices of grains and oilseeds will contribute to a strong positive trade balance
