EVALUATION OF THE NORTH DAKOTA
COMMUNITY ASSISTANCE PROGRAM

Theresa K. Golz
James F. Baltezore
Jay A. Leitch

Report to North Dakota State Parks and Recreation Department in fulfillment
of cooperative agreement dated January 15, 1987.

Acknowledgements

The authors would like to thank residents from the communities of Ashley, Casselton, Garrison, Grafton, Mayville/Portland, and Woodworth who responded to our surveys. Thanks is extended to the CAP coordinators in each of the communities for their participation and cooperation. They were:

<u>Community</u>	<u>CAP Coordinator</u>
Ashley	Mary King
Casselton	Jeri Ann Fugleberg
Garrison	Lisa Leker and Judy Stammness
Grafton	Wayne Mathison
Mayville/ Portland	Dennis Eastman
Woodworth	Marcia Odenbach

Thanks is also extended to Carol Jensen, Cindy Schuler, and Marna Unterseher who typed the manuscript and Carmen Norskog and Taunya Hoffman who assisted with data entry.

The North Dakota Parks and Recreation Department provided financial support.

HIGHLIGHTS

The purpose of this study was to evaluate the effect of North Dakota's Community Assistance Program (CAP) on the availability and awareness of leisure time and self improvement resources and its impact on the quality of life experienced by residents of participating communities. Communities participating in the program were Ashley, Casselton, Garrison, Grafton, Mayville/Portland, and Woodworth. Criteria used to measure improvement in the quality of life were increased participation in community activities, increased opportunities for participation, and improved quality indicators by program areas. Program areas included individual and team/league recreation, social services, and education and culture.

Most CAP communities experienced increased program availability and awareness. Four of the six communities (Ashley, Woodworth, Garrison, and Grafton) had increases in the average availability and awareness within each program area. Generally, these communities responded well to the CAP initiative.

Individual recreational activities had the largest increase in availability and awareness (7 percent) among CAP communities on average. Team/league activities and social services availability and awareness increased 3 percent on average. Educational and cultural programs increased only fractionally. Availability and awareness among all program areas increased an average of 4 percent.

EVALUATION OF THE NORTH DAKOTA COMMUNITY ASSISTANCE PROGRAM
Theresa K. Golz, James F. Baltezare, and Jay A. Leitch¹

INTRODUCTION

Legislation creating a Community Assistance Program (CAP) to address recreational needs of North Dakota communities was passed by the 1985 Legislative session. The Community Assistance Program was designed to provide (1) matching funds for a leadership program and (2) a facilities grant program.

Leadership grant program monies were to be available on a 25 percent (local)-75 percent (state) matching basis to communities (particularly those with populations less than or equal to 13,000) allowing them to hire an individual to develop and coordinate community service programs. Community service programs included recreation programming for youths, adults, senior citizens, special populations, and the handicapped. The local sponsor's share would increase by 25 percent annually until the program was fully funded locally.

Because of the proposed elimination of the federal Land and Water Conservation Fund (LWCF), the facilities grant program was designed to allow local political subdivisions to renovate or construct parks and recreational facilities on a 50/50 matching basis. The program was administered by the North Dakota Parks and Recreation Department in the same way as it previously awarded LWCF monies.

Although the bill was approved in both the House and the Senate, appropriations from the state were removed. The law (N.D. Cent. Code §55-08-14.1) now allows the program to be established with "monies made available." The North Dakota Parks and Recreation Department worked with the North Dakota Recreation and Park Association and the community education division at North Dakota State University (NDSU) to administer a pilot program for the leadership grant portion of the CAP. Monies made available for the program consisted of an Otto Bremer Foundation grant and a planning grant from the Land and Water Conservation Fund Program.

Community Assistance Program (CAP)

The goal of the CAP was to improve the quality of life in small, rural communities, maximize the use of existing community facilities, and improve coordination of community-wide activities. CAP was intended to help small communities, their farmers and related business persons, deal with the current farm crisis. Leaders, educational programs, social services, and recreational activities were provided by CAP communities.

¹Authors are graduate research assistant, research assistant, and associate professor, respectively, Department of Agricultural Economics, North Dakota State University, Fargo.

Six communities were selected to serve as demonstration CAP sites (Figure 1). Cap eligible communities were those with populations less than or equal to 13,000. Half of the communities selected (Grafton, Casselton, and Woodworth) had to contain Otto Bremer Banks (since part of the project funding was provided by the Otto Bremer Foundation). The remaining communities were selected after a community evaluation conducted by a panel consisting of members from the North Dakota Parks and Recreation Department and the North Dakota Recreation and Park Association.

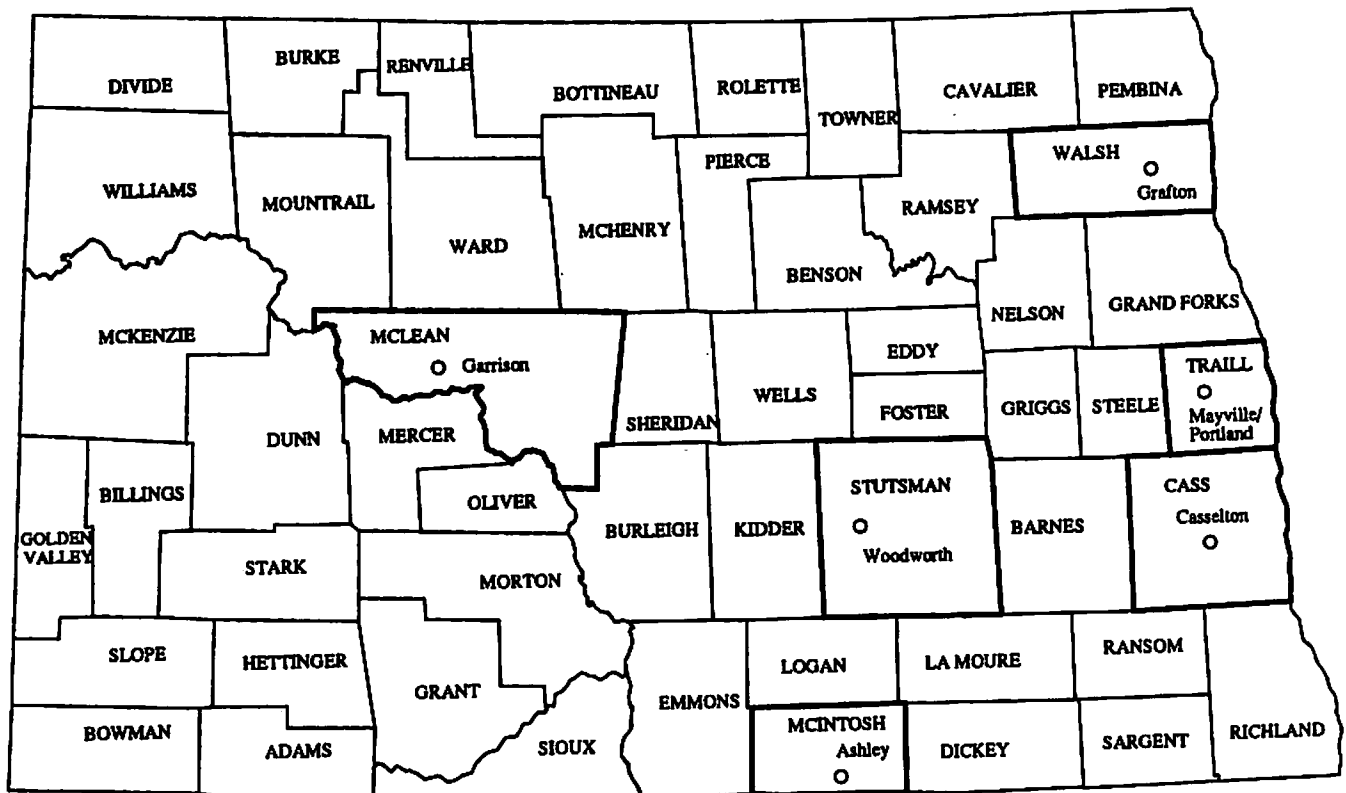

Figure 1. CAP Communities

The object of this study was to evaluate the effect of the CAP on the quality of life in these six participating North Dakota cities. Criteria for measuring improvement in the quality of life are:

- increased levels of community participation in and awareness of scheduled activities,
- increased opportunities for community participation, and
- improved resident attitudes regarding quality of life indicators affected by the program.

The CAP is designed to be the first step in implementing a community leadership plan that can help small communities and their citizens deal with the current farm crisis. Evaluation of the CAP program will provide information to the North Dakota Parks and Recreation Department, North Dakota Parks and Recreation Association, and the Center for Community Education so that they can improve the program and encourage other communities to participate in the future.

PROCEDURE

An evaluation method of pre- (ex ante) and post- (ex post) CAP was developed to assess changes during the 18-month program. An ex ante or baseline survey and a community inventory were conducted to determine existing recreational activities, social services, and educational and cultural programs available. This survey established a standard or base from which comparisons could be made. Monthly reports of notable accomplishments were prepared by the six community coordinators. An ex post survey and inventory were conducted and compared with the baseline survey and inventory so that the effectiveness of the CAP in improving the quality of life in these communities could be assessed.

Baseline (Ex Ante) Survey

The community baseline survey (Appendix A) was explained to community coordinators at a training meeting on January 16, 1987. On January 27, 1987, a supply of questionnaires was sent to each of the six communities. The questionnaires were to be completed and returned to the Department of Agricultural Economics, North Dakota State University, by February 27, 1987. Survey objectives were to determine recreational activities and social and educational opportunities residents believed to be available or were aware of, and activities or opportunities community residents would like available. The survey provided a baseline "snap shot" of the community prior to the CAP.

Each community coordinator was required to administer questionnaires to reach a desired sample size. Sample sizes were based on community population. Community population consisted of the city and townships surrounding the city (Table 1). Community populations ranged from 456 in Woodworth to 7,765 in Grafton. Only Ashley achieved the predetermined sample size (Table 2). Communities not obtaining the predetermined sample size were given until April 17, 1987 to administer more questionnaires.

Baseline survey responses ranged from 54 percent (Grafton) to 94 percent (Ashley). The overall response rate for CAP communities was 73 percent.

Baseline (Ex Ante) Inventories

Inventories consisted of human and physical resources and current recreational, social, and educational programs (Appendix B). Human resources includes people having expertise in certain areas and willing to teach a class. Physical resources refers to the number of facilities available (school rooms, tennis courts, and libraries). The current programs section was intended to identify activities presently available. The purpose of the inventories was to determine what resources were available in the community when the CAP began.

Baseline inventories were explained and distributed to community coordinators in January 1987. Inventories were to be completed and returned by February 27, 1987.

Ex Post Survey

Questionnaires (Appendix C) were given to each community coordinator in April 1988 to be completed by the end of the study (May 1988). The same number of questionnaires completed in the baseline survey were to be completed for the ex post survey in each community. The purpose of the ex post survey was to assess changes in the availability and awareness of programs from the baseline survey. Response rates ranged from 60 percent (Mayville/Portland) to 100 percent (Garrison and Grafton). The overall ex post survey response rate was 81 percent (Table 3).

TABLE 3. EX POST SURVEY RESPONSE RATES, BY CAP COMMUNITY

Community	Questionnaires Supplied	Questionnaires Returned	Response Rate
Ashley	113	77	68
Casselton	77	67	87
Garrison	95	95	100
Grafton	130	130	100
Mayville/Portland	149	90	60
Woodworth	45	35	78
TOTAL	609	494	81

Ex Post Inventories

Additional resources not in the baseline inventory were to be reported in the ex post inventory taken during April and May 1988. Resources no longer available were to be omitted. An explanation was to be included regarding why the resources were no longer available.

CAP Coordinator Personal Interviews

Personal interviews with community coordinators were conducted following completion of the 18-month CAP. The purpose of the personal interviews (Appendix D) was to determine how CAP coordinators viewed themselves as being accepted and supported by residents in the community. Also, they were asked to describe advantages and disadvantages of being CAP coordinators.

RESULTS

Data from both the baseline (ex ante) and ex post surveys and inventories were compiled for each CAP community. While highlights from the other five communities will be mentioned, only Ashley will be discussed in detail. Results of both the baseline and ex post surveys for communities other than Ashley are presented in Appendices E through I.

Community Assistance Program (CAP)

The CAP was assessed by comparing results from the baseline and ex post surveys. Differences between the two should be the result of the CAP initiative and its relative impact on each community. The magnitude of these differences or changes should provide insight as to the relative effectiveness of the CAP among communities.

Ashley

Baseline Survey

Ashley residents indicated that most individual recreational activities listed in the survey instrument (68 percent) were available in 1987 (Table 4). Exceptions were rollerskating, horseshoes, and cross-country skiing. Sixty-eight respondents indicated that they would like rollerskating available. The average preference ranking for rollerskating was 2 (column c, Table 4) (on a scale of 1 for strongly agree to 5 for strongly disagree), which means respondents agreed that rollerskating should be available. Fifteen residents indicated that they would like curling available. However, the average preference ranking was 3 which means that respondents were indifferent as to whether curling should be available.

Most social services listed were available in 1987 except for blood pressure training, senior citizen tax assistance, food pantry, and mental health services. Respondents were indifferent (3 ranking) as to whether these services should be provided (except for blood pressure training which had a preference ranking of 2). Overall availability of social services was 44 percent.

In general, education and cultural opportunities were lacking according to respondents, with an overall availability of only 14 percent. Program areas not available included gourmet cooking, word processing, upholstery, photography, self defense, snowmobile safety, color analysis, and cultural activities as a whole.

Ex Post Survey

Eighty-four percent of the individual and 64 percent of the team/league recreational activities listed were indicated as available in 1988 based on responses to the ex post survey (Table 4). Availability of social services was 49 percent. The availability of education and cultural events was 23 percent.

^cNumber represents those respondents who answered either 1 for strongly agree or 2 for agree.

SOURCE: Community Survey, January-March 1987 and April-May 1988.

Availability and Awareness Changes

Differences in availability among the four program areas from the baseline and ex post surveys represents changes in both program availability and awareness. An increase in availability among surveys in a particular program area could indicate that more programs are now available and/or that more people in the community are now aware that programs are available. Differences among the two surveys thus represent changes in both program availability and awareness as a result of the CAP initiative.

The availability and awareness of individual recreational activities increased from 68 percent for the baseline survey to 84 percent for the ex post survey. Recreational team/league activities and social services availability and awareness remained nearly constant during the CAP. The overall availability and awareness of education and culture programs increased from 14 percent for the baseline survey to 23 percent for the ex post survey.

Comparing the baseline and ex post survey results shows considerable increases in the availability and awareness of certain activities. For example, rollerskating availability and awareness increased from 2 percent

to 70 percent. Tennis courts were used certain hours during the summer months as a rollerskating area. Availability and awareness of horseshoes increased from 16 percent to 75 percent. This increase was the result of horseshoe pits being built during the CAP in preparation for the Ashley centennial. First aid availability and awareness increased 30 percent because of increased communication efforts. A class on gourmet and ethnic cooking was responsible for a 60 percent increase in the availability and awareness within this activity area. Photography, flower arranging, self-defense, karate, hunter and snowmobile safety, and color analysis had increased availability and awareness as a result of classes being initiated in each area.

Other CAP Communities

Figures 2 through 5 summarize changes in the availability and awareness of activities for each CAP community and program area for the baseline and ex post surveys.

Availability and awareness of recreational activities and educational and cultural programs remained nearly constant for the Garrison community during the CAP (Appendix E). Garrison showed no real changes in the availability and awareness within these specific program areas between the baseline and ex post surveys. However, social service availability and awareness increased 7 percent between surveys.

The Casselton community experienced a general decline in the overall availability and awareness of activities and programs (Appendix F). The largest decline in the availability and awareness of programs was in individual recreation which declined from 52 percent for the baseline survey to 39 percent for the ex post survey. Apparent declines may be the result of differences in respondent characteristics among the baseline and ex post sample groups. Inconsistencies in how surveys were administered and completed during the two time periods may have also been a contributing factor.

Grafton experienced increases in the overall availability and awareness among program areas (Appendix G). The largest increase in availability and awareness was in the recreational team/league activities which increased from 43 percent for the baseline survey to 63 percent for the ex post survey.

The availability and awareness of activities in the Mayville/Portland community generally declined during the CAP (Appendix H). The largest decline was experienced in educational and cultural programs which dropped from 13 percent to 5 percent between the baseline and ex post surveys, respectively. Declines may be attributed to sampling inconsistencies, improper administration of the surveys, and a lack of support for the CAP program and coordinator by the community.

Woodworth experienced somewhat higher availability and awareness of activities among program areas (Appendix I). The greatest increase was in individual recreational activities which increased from 13 percent before the CAP to 38 percent after the CAP.

Figure 4. Availability and Awareness of Social Service Programs, by CAP Community

Figure 5. Availability and Awareness of Educational and Cultural Programs, by CAP Community

Figure 2. Availability and Awareness of Individual Recreational Activities, by CAP Community

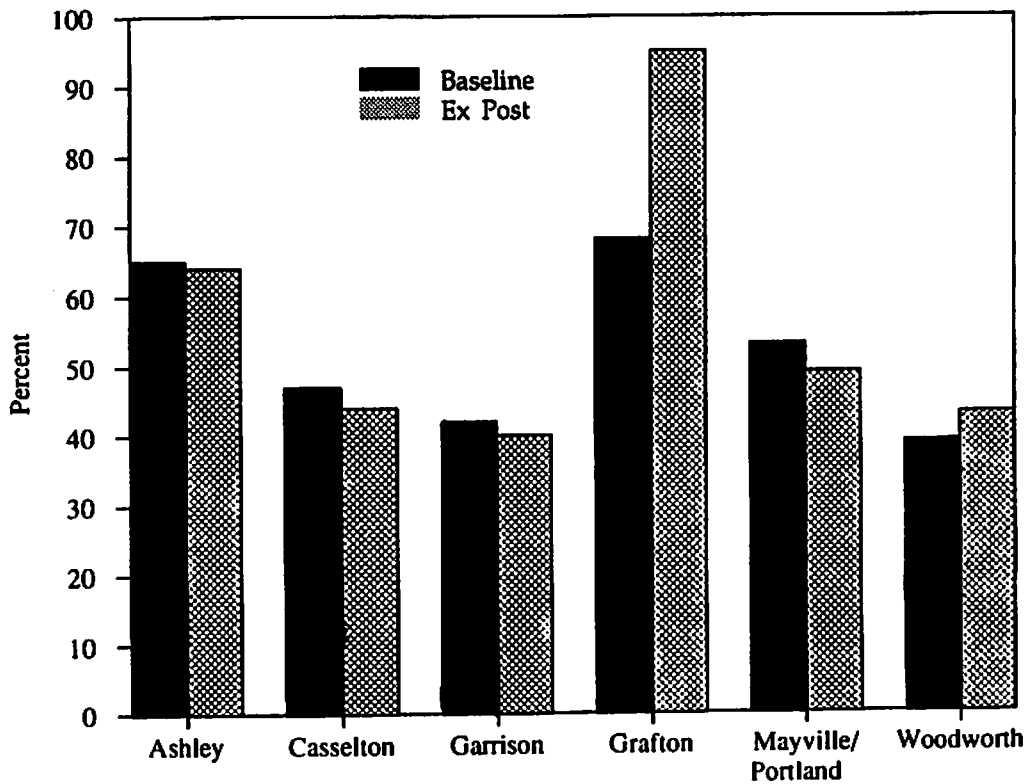

Figure 3. Availability and Awareness of Team/League Recreational Activities, by CAP Community

Inventories

Inventories of human resources (Table 6), current programs (Table 7), and physical resources (Table 8) were recorded by the CAP coordinators for each of the communities. Inventories were taken in February 1987 and May 1988. Human resources available to each community remained fairly constant between the baseline and ex post inventories except for Casselton. The number of instructors/coaches in Casselton increased from 7 to 32. Recreational, social, and educational programs in the communities were similar among inventories, except for Casselton, where the number of programs offered increased from 15 to 34. Physical resources were similar among the baseline and ex post inventories for each community.

Personal Interviews with Coordinators

Personal interviews were conducted with each CAP coordinator in April 1988. When asked how the people in the community accepted the coordinator, the consensus was that residents were hesitant, at first, to cooperate with the CAP coordinators and participate in CAP activities. However, resident attitudes changed and support improved as programs were initiated. Constraints of the CAP as seen by coordinators were lack of support from governing bodies, no operating money, and lack of information.

SUMMARY

Generally, most CAP communities experienced increases in the availability and awareness of programs. Four of the six communities (66 percent) had increases in the average availability and awareness within each program area. Most of the increase can be attributed to increases in the average availability and awareness of programs in the Grafton, Woodworth, and Ashley communities.

Changes in availability and awareness from the baseline survey to the ex post survey varied among program areas and across CAP communities (Table 9). Ashley experienced a 7 percent increase in the availability and awareness of activities within each program area on average. Most of the increase was due to a 16 percent increase in the availability and awareness of individual recreational activities which more than offset the 2 percent decline in the availability and awareness of team/league recreational activities.

Woodworth residents experienced an 11 percent increase on average in the availability and awareness of programs. Most of the increase can be attributed to a 25 percent increase in the availability and awareness of individual recreational activities and an 11 percent increase in social services. There were also increases in the availability and awareness of team/league activities and educational and cultural programs.

Respondent Characteristics

Respondent characteristics in Ashley were similar between the baseline and ex post surveys (Table 5). The average number of years residents had lived in the community was 19 and 16 for the baseline and ex post surveys, respectively. Most respondents lived in town and had no children. The average age of respondents was 32 years old. The percent of respondents in each occupation was similar among surveys.

Respondent characteristics of Woodworth, Grafton, and Garrison remained relatively homogenous when comparing the baseline and ex post surveys (Appendices E through I). However, Mayville/Portland and Casselton respondent characteristics were somewhat different. Mayville/Portland's occupational characteristics changed from 55 percent to 20 percent professional and technical occupations and from 15 percent to 50 percent retired and student occupations among the baseline and ex post surveys, respectively. Casselton respondent characteristics varied from 81 percent living in town in the baseline survey to 63 percent in the ex post survey. Sales and farming occupations increased from 8 percent to 32 percent of the respondents among surveys. Differences in respondent characteristics may be one reason why these communities did not appear to respond favorably to the CAP initiative.

TABLE 9. PERCENTAGE CHANGE IN AVAILABILITY/AWARENESS OF PROGRAMS AND ACTIVITIES, BY PROGRAM AREA

Program Area	CAP Communities						Overall	Excluding Casselton and Mayville/Portland
	Ashley	Woodworth	Casselton	Garrison	Grafton	Mayville/Portland		
Individual recreation	+16.0	+25.0	-13.0	+0.8	+20.7	-5.6	+7.3	+15.6
Team/league recreation	-1.5	+3.6	-3.4	-2.0	+26.9	-4.3	+3.1	+6.6
Social services	+5.0	+10.8	-6.0	+7.3	+2.0	+0.9	+3.3	+6.3
Education and culture	+8.5	+3.5	-9.0	-1.2	+13.0	-8.3	+1.1	+6.0
AVERAGE	+7.0	+10.7	-7.9	+1.2	+15.7	-4.3	+4.0	+8.6

Garrison had only a slight increase in the availability and awareness of programs (1 percent on average). Most of the increase can be attributed to a 7 percent increase in social services offered. This increase was nearly offset by decreases in the team/league recreational activities and educational and cultural programs.

Grafton experienced the largest average increase in program availability and awareness (16 percent). Most of the increase was the result of a 27 percent and a 21 percent increase in the availability and awareness of team/league and individual recreational activities, respectively. Education and culture and social services also had increases in program availability and awareness.

Poor showings in Casselton and Mayville/Portland communities for the CAP initiative were the result of a combination of factors. Respondent characteristics among surveys were different. Eighty-one percent of the respondents in the Casselton community from the baseline survey lived in town, while only 63 percent lived in town from the ex post survey. This implies that those living in town may have been more informed and/or supportive of the CAP than rural residents. The occupational profile of respondents surveyed in Casselton showed that the number of respondents who were farmers or in sales occupations increased dramatically while the number of respondents in service occupations declined from 24 percent to 8 percent. A profile of respondent characteristics from the Mayville/Portland community shows that the number of retired and student respondents surveyed increased from 15 percent for the baseline survey to 50 percent for the ex post survey.

Inconsistencies in how surveys were administered and completed by respondents may have also been a factor contributing to an apparent decline in the average availability and awareness in program areas for the Casselton and Mayville/Portland communities. There appeared to be some problems in the way respondents completed the ex post surveys. Inconsistencies in the ex post surveys were caused by improper administration as to who should be surveyed, incomplete or inaccurate instructions regarding how to complete the questionnaire, and a lack of interest by survey respondents in completing the questionnaire.

Individual recreational activities had the largest increase in availability and awareness (16 percent on average excluding Casselton and Mayville/Portland) across CAP communities. Most of the increase can be attributed to increases in availability and awareness of 15 percent or more in the communities of Ashley, Woodworth, and Grafton. Team/league, social services, and education and culture program areas experienced average increases of about 6 percent. The overall average availability and awareness among all program areas increased 9 percent.

CONCLUSIONS

Grafton, Woodworth, Ashley, and Garrison responded well to the CAP initiative. The CAP was effective in improving the quality of life measured in terms of increased availability and awareness of programs and activities in these communities.

The CAP in Casselton and Mayville/Portland was not as successful as the other CAP communities. These communities experienced decreases in the average availability and awareness among program areas. The CAP in these communities did not appear to be successful because of a combination of factors including differences in respondents surveyed and inconsistencies in survey procedures.

Generally, the CAP seemed to be successful in improving the quality of life of residents living in these small, rural communities. A majority of the communities participating did experience increases in community participation in and awareness of scheduled activities. Increased opportunities for community participation in these program areas should improve resident attitudes regarding the quality of life in rural North Dakota.

 How long have you lived in the (name of town) community? _____

Do you live in town ___ yes ___ no

If not, how far do you live from (name of town)? _____ miles

What is your occupation? _____

What is your age? _____

Do you have any children under 20 years of age? ___ yes ___ no

List ages _____

APPENDIX D
CAP COORDINATOR PERSONAL INTERVIEWS

1. How did the people in your community accept you when you began working?
2. Have their feelings changed?
3. Do they come to you with suggestions?
4. Have you had good support in the activities that you organized?
5. Do kids participate? Are they satisfied with the number of activities?
6. What have been the strong points (advantages) of your job?
7. Disadvantages of job?
8. Could the community continue the support of a community coordinator?

Would you start the job again?

What would you do differently?

Constraints keeping from doing a good job.
