## Trade-offs in the Pasture, Rangeland and Forage Rainfall Index (PRF-RI) Insurance Purchase Decision

NC-1177 Annual Meeting - Minneapolis, MN  
October 3, 2017

Matthew Diersen & Scott Fausti

# South Dakota Rainfall and Hay Yields, 1917-2016

# Ifft, Wu and Kuethe (2014)

- Explicitly test for changes in pasture land values before and after introduction of PRF
  - e.g.,  $V_{pasture} = X_{it}\beta + \delta PRF_t + \epsilon$
- Also test for impact of length of adoption (> 3 years) and intensity of adoption (% of eligible land covered)
- Found 4-9% increase or premium in  $V_{pasture}$ 
  - May get capitalized like other payments

# Maples, Brorsen and Biermacher (2015)

- Cites Chavas and Jones (1993) study finding negative relationship between land prices and risk
- Present land values as a function of rents (+), variance of rents (-), risk aversion (-), and time- (and risk-adjusted) discount rate (-)
- Findings show riskier returns associated with:
  - Lower land values
  - Lower rental rates
  - Higher risk-adjusted returns

# Diersen, Gurung and Fausti (2015)

- Rainfall and hay yields are positively correlated at the state and county levels
- Possible to construct a portfolio with PRF intervals as decision set
- Optimal portfolio is “close” to equally-weighted interval loadings
- Variance reduction possible by weighting critical periods more heavily

# 2017 Acres Insured with PRF

**U.S. Total:  
75.0 mil.**

# U.S. Acres Insured with PRF

# 2012 Census of Agriculture, Land

<b>Land Use</b>	<b>United States (acres)</b>	<b>South Dakota (acres)</b>
Land in farms	914,527,657	43,257,079
Permanent pasture	415,309,280	22,545,069
Woodland pastured	27,999,006	180,751
Other pasture	12,802,847	518,702
Forage harvested	55,775,162	2,615,889

# U.S. PRF Loss Summary

# Accommodating, Complex Choice

Example 1. A portion of eligible acres is spread equally across several intervals.

	Feb-Mar	Apr-May	Jun-Jul	Aug-Sep	Oct-Nov	
		250	250	250		
Jan-Feb	Mar-Apr	May-Jun	Jul-Aug	Sep-Oct	Nov-Dec	

Example 2. All eligible acres are covered with the maximum and minimum allowed in single intervals.

	Feb-Mar	Apr-May	Jun-Jul	Aug-Sep	Oct-Nov	
			200	100		
Jan-Feb	Mar-Apr	May-Jun	Jul-Aug	Sep-Oct	Nov-Dec	
	700

State Experiment Farm and Antelope...

# Harding County/District Grass Hay Yields (tons/acre), 1996-2016

# Hypothetical Antelope Station Situation

- Buying replacement hay would have occurred in 7 of 21 years
- Average feed cost of \$11.23 per acre for sample (in today's dollars)
- Masks per acre extremes of \$12.80 (2012), \$30.30 (2006) and \$80.30 (2002)
- Likely capitalized in “lower” land values
- Quantifies “cost” that could be reduced with insurance

# PRF-RI Returns

- Rainfall index is actuarially robust
  - A subtle point often ignored by researchers and practitioners
- Premiums by interval reflect underlying distribution of rainfall
- Overall cost is about 15% of the full program cost; aggregate indemnities are typically 85% of aggregate premiums
- PRF-RI buyer typically pays less than 50% of total premium; expect to net \$0.70 per \$1.00 spent

# Antelope Station Back Test

	J-F	M-A	M-J	J-A	S-O	N-D
Premium (\$/acre)	11.90	11.00	7.80	7.40	15.00	14.24
E(Indemnity)	8.33	7.70	5.46	5.18	10.50	9.97
E(NPV)	106.80	98.72	70.00	66.41	134.62	127.80
Correlation w/Hay Loss	0.24	-0.45	-0.34	-0.37	-0.43	-0.44
Actual Average Net						
NPV <sub>21</sub>						

# Antelope Station Back Test

	J-F	M-A	M-J	J-A	S-O	N-D
Premium (\$/acre)	11.90	11.00	7.80	7.40	15.00	14.24
E(Indemnity)	8.33	7.70	5.46	5.18	10.50	9.97
E(NPV)	106.80	98.72	70.00	66.41	134.62	127.80
Correlation w/Hay Loss	0.24	-0.45	-0.34	-0.37	-0.43	-0.44
Actual Average Net	8.34	3.00	9.26	-0.48	1.62	15.01
NPV <sub>21</sub>	140.23	32.3	141.71	-17.90	1.36	154.62

# Variables

P – Hay price (\$/ton)

Y – Hay yield (ton/acre)

C – Coverage level (e.g., 90%)

b – Base price (\$/acre)

Z – Productivity index (0.6-1.5)

$R_i$  – Interval indemnity (\$/acre)

$S_i$  – Interval weight (0 or .1-.7)

$sp_i$  – Subsidized premium (\$/acre)

# Expected Returns & Risk

$$\text{Max } \sum_t [-PE(Y - C\bar{Y}) + \varphi bE[(R_1 - C)S_1 + \dots +$$

# Modeling

- Used Excel solver to back test portfolios with equal weights and those on the frontier with  $C=0.90$
- Used county hay yields (NASS) and rainfall data from 1996 to 2016 (RMA)
- Used 2018 base prices and premiums (assumes historic yield losses occur at current costs)

# Antelope Station Portfolios

# Antelope Station Weights

	(% Acres per Interval)					
	J-F	M-A	M-J	J-A	S-O	N-D
<b>Equal Shares (-.62)</b>	<b>17%</b>	<b>17%</b>	<b>17%</b>	<b>17%</b>	<b>17%</b>	<b>17%</b>
<b>Correlation</b>	<b>0.24</b>	<b>-0.45</b>	<b>-0.34</b>	<b>-0.37</b>	<b>-0.43</b>	<b>-0.44</b>
<b>Less Risk (-.69)</b>	<b>0%</b>	<b>39%</b>	<b>0%</b>	<b>27%</b>	<b>0%</b>	<b>43%</b>
<b>Min. Risk (-.83)</b>	<b>0%</b>	<b>35%</b>	<b>0%</b>	<b>37%</b>	<b>18%</b>	<b>10%</b>
<b>More Return (-.65)</b>	<b>0%</b>	<b>38%</b>	<b>0%</b>	<b>20%</b>	<b>0%</b>	<b>43%</b>
<b>Max. Return (-.37)</b>	<b>30%</b>	<b>0%</b>	<b>0%</b>	<b>0%</b>	<b>0%</b>	<b>70%</b>

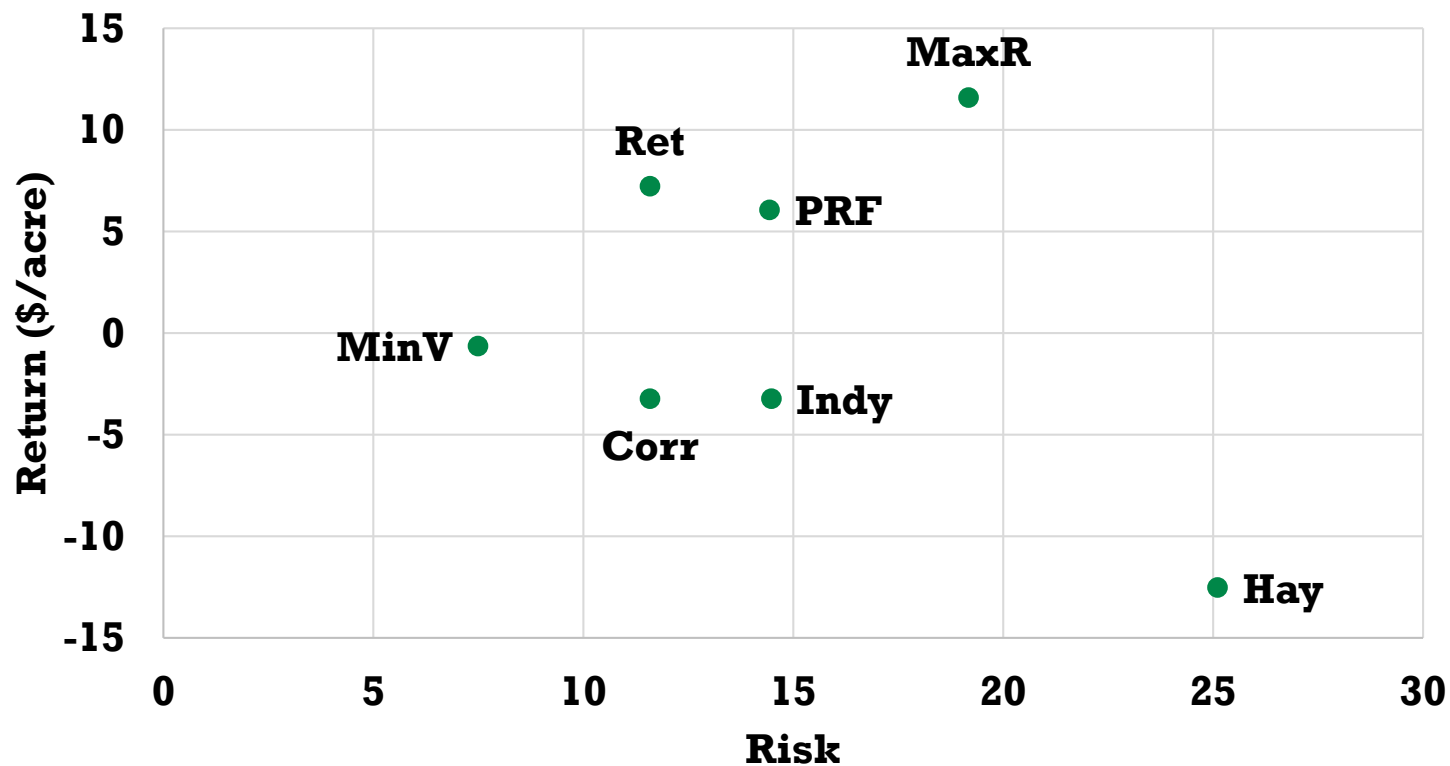

# PRF Implications

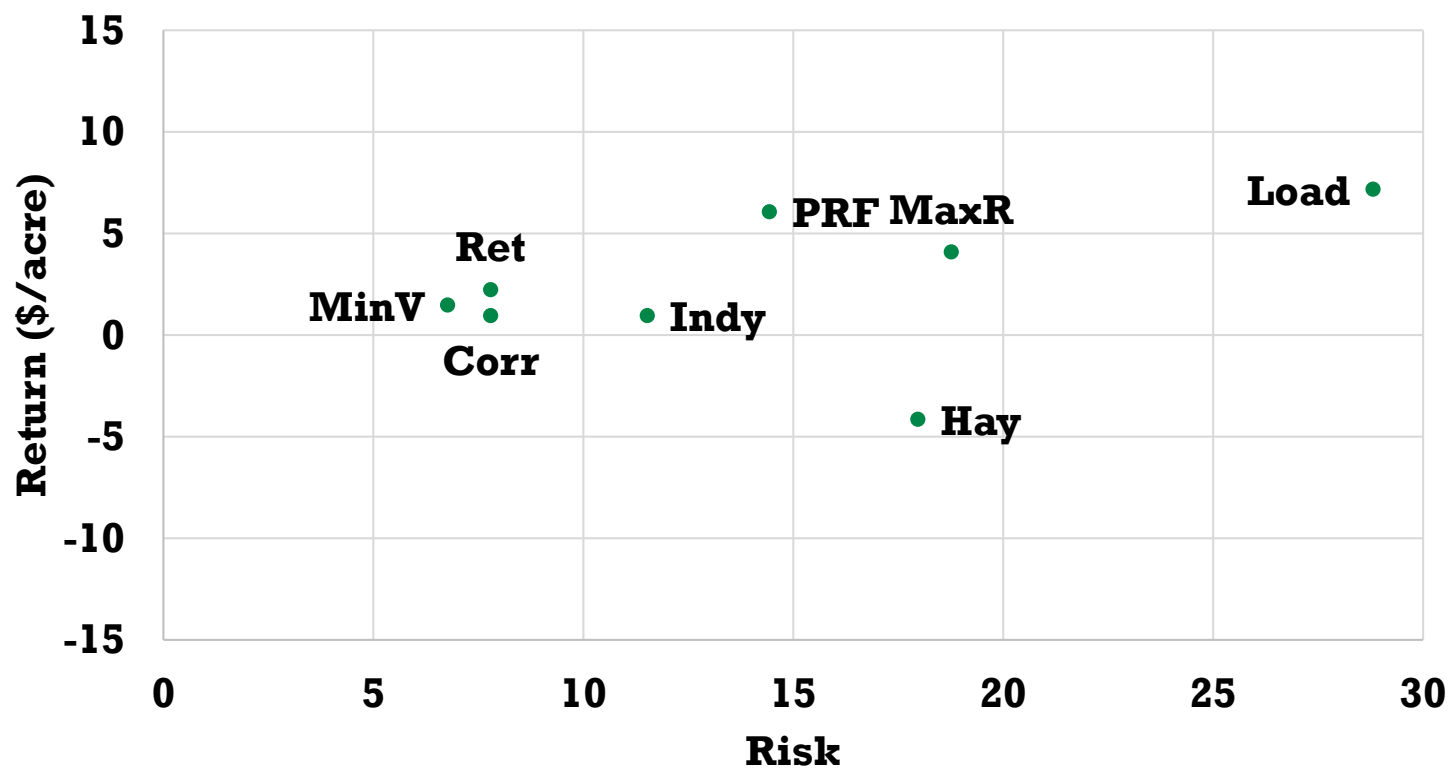

- Draws from any single interval may:
  - Lead to very long lags in indemnities
- Payoffs from an inclusive portfolio capitalizes on covariance across intervals
  - Premium of \$11.22,  $E(NPV) = \$100.77$ ,  $NPV_{21} = \$75.39$
- Inclusive portfolio is unlikely to need other equity or financing to sustain coverage
- Productivity index may be adjusted to match feed replacement needs without affecting indemnity frequency
