The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, DC 20250, or call 1-800-245-6340. USDA is an equal employment opportunity employer.

**Injuries and Fatalities on U.S. Farms.** By Jack L. Runyan. U.S. Department of Agriculture, Economic Research Service, Food and Rural Economics Division. Agriculture Information Bulletin No. 739.

## **Abstract**

U.S. farmworkers suffered 673 fatal and 64,813 nonfatal accidents in 1992. Fatal injuries occurred at a rate of 0.3 per 1,000 U.S. farms and per 1,000 farms with hired labor expenditures. Farm operators and family members accounted for about 32 percent of nonfatal injuries, while 44,383 hired laborers were injured while engaged in farmwork. This study, using 1992 Census of Agriculture data, analyzes fatal injuries by State, and nonfatal injuries by the operators' primary occupation, age, and tenure group, and by farm type, acreage, sales, commodity, and location.

**Keywords:** Farm injuries, hired farmworker injuries, farm operator injuries.

## **Acknowledgment**

The statistical procedures used for the data analysis were developed by Charlie Hallahan, ERS.

## Summary

Farm operators and their families suffered 72 percent of the 673 work-related farm fatalities in 1992 and a third of the 64,813 nonfatal farming injuries. Hired farmworkers endured 44,383 nonfatal and less than a third of fatal farmwork-related injuries, according to the 1992 Census of Agriculture.

Farming has one of the highest fatality rates of all occupations, according to the U.S. Department of Labor. Farmers and farmworkers receive little formal safety training and often work alone and far from assistance should an injury occur.

The total of 673 farmwork-related fatalities was 1 for every 2,861 farms--the United States had more than 1.9 million farms in 1992. Total injuries averaged 1 for every 29 farms.

Farm operator and family member fatality rates in Delaware, Indiana, Iowa, Minnesota, and Wisconsin were higher than the U.S. average per 1,000 farms. Arizona, California, Florida, Idaho, Louisiana, and Maryland reported higher-than-average fatality rates among hired laborers per 1,000 farms that reported labor costs.

Of the 64,813 nonfatal injuries, about 32 percent were to farm operators and family members, a rate of about 10.6 injuries per 1,000 farms.

Hired workers suffered about 64 injuries per 1,000 farms with labor costs.

Hired workers were injured at a higher rate on the following types of farms:

- Farms where operators characterized farming as their principal instead of secondary occupation;
- Farms where the operator was 45 to 64 years old;
- Farms with tenant operators rather than operators who were partial or full farm owner;
- Farms of 1,000 acres or more;
- Farms with sales at or over \$500,000;
- Farms producing mainly horticultural-specialty products;
- Farms owned by corporations other than the primary farm operator; and
- Farms located in California, Connecticut, Florida, and, especially, Hawaii.

Connecticut, Nevada, and Hawaii had the greatest injury rates per 1,000 hired workers, while the lowest rates were in Kentucky, North Dakota, and Tennessee.

Farm operators and family members were nonfatally injured at higher rates when the operators' occupation was farming, the operators were 44 years old or younger and part owners, and the farms were family-held corporations, over 1,000 acres, sold at least \$500,000 in agricultural products, primarily produced dairy products, and were in the Lake States region. Wyoming, Wisconsin, Vermont, and New York had the highest injury rates per 1,000 farms for operators and their family members; Texas, Tennessee, Alabama, Mississippi, Georgia, and Louisiana had the lowest rates.

The greater number of injuries in both the Lake States region and on farms pro-

ducing dairy products may be related. Dairy farms' slippery surfaces, combined with colder temperatures, may produce more hazardous working conditions.

The risk of injury varies with characteristics of farmers and farms. This study is a limited analysis of the fatal farm injuries and a broader analysis of nonfatal farm injuries in 1992, the first year such data are available in the Census of Agriculture.

It may be possible to reduce the risk of occupational injuries through regulation, engineering, education, or a combination of these methods. However, each method has limitations. Most farming operations are exempt from Federal regulations. Farm machinery's longevity outlasts many safety devices, which are not replaced, and safety innovations take years to become widely used. Developing effective farm safety education programs requires the cooperation of all parties involved in farming (operators, family members, farmworkers, manufacturers, researchers, and farm safety specialists).

# Injuries and Fatalities on U.S. Farms

Jack Runyan

## Introduction

Farming, by its very nature, creates an environment conducive to injuries and illnesses and presents unique safety problems not found in most industries. Home and worksite are the same location for most farm operations, and children play on and around machinery and animals, exposing farmers and their family members to hazards associated with animals, machinery, tools, and chemicals. Farming is usually not performed in packages of 40-hour weeks but in an erratic tempo dictated by weather, season, and climate. During planting and harvesting periods, farmers, their family members, and hired workers may work long, fatiguing hours, and may be less cautious while operating equipment and handling livestock. Farmers and farmworkers receive little formal safety training, and they often work alone and far from assistance should an injury occur. Emergency services in many rural areas are distant from the farm and often not equipped to handle more severe farm injuries (Murphy, Runyan).

Congress, in the Food, Agriculture, Conservation, and Trade Act of 1990, directed the Secretary of Commerce to include questions relating to agricultural accidents and farm safety in the 1992 Census of Agriculture. Therefore, the 1992 Census of Agriculture is the first farm census to include a count of work-related injuries and deaths on the farm (see Glossary). The Bureau of the Census asked, "Were there any injuries or deaths connected with farm or ranch work on or for this place in 1992?" If the respondent answered "yes," he or she was asked how many operator and family members and/or hired workers experienced injuries or work-related deaths.

There were 64,813 nonfatal injuries and 673 fatal injuries on U.S. farms in 1992, according to the 1992 Census of Agriculture. Hired workers were involved in 68 percent of the nonfatal injuries and 27 percent of the fatal ones.

A recent study of farm injuries in a five-State area (Minnesota, Nebraska, North Dakota, South Dakota,

and Wisconsin) showed that about 72 percent of farm injuries were sprains/strains, contusions, lacerations, and fractures (Gerberich et al.). More than half of the injuries were to the back, fingers, arms, eyes, hands, and legs. The most frequent periods of restricted activity resulting from a farm injury were from 1 to less than 7 days.

Farming has one of the higher rates of fatal injuries of all occupations (along with timber cutting, fishing, and airplane pilots), according to a study of fatal work-related injuries by the U.S. Department of Labor. In 1993, farm operators and managers accounted for 30 percent of the fatal injuries to self-employed individuals while accounting for only 10 percent of the self-employed population (Personick and Windau). Most of these fatalities resulted from tractor accidents. The same study also reported that wage and salary workers in agriculture also face fatality risks much higher than their 2-percent share of wage and salary employment suggests (Personick and Windau, p. 28).

This report has two parts. The first part is a limited analysis of farm fatalities. The second is an analysis of the nonfatal farm injuries to operators and family members and to hired workers reported in 1992 by operator characteristics (primary occupation, age, and tenure group) and farm characteristics (type of organization, acreage, sales, commodity, and location). The rates of injury in each category and in States are compared with the U.S. averages to determine levels of significance at the 95-percent confidence level (Kanji). Unfortunately, the data do not allow for an analysis of cause, type, or severity of the nonfatal injuries. Demographic data (such as age, gender, or relationship to the operator) on the injured parties are also not available. Data were not readily accessible for individual farms, so analysis was performed on categories.

## Fatal Farm Injuries

There were 490 operators and family members fatally injured on 482 U.S. farms in 1992 (table 1), a rate of

**Table 1—Fatalities on farms by State, 1992**

\* Significantly different from the U.S. average at the 95-percent confidence level.

d = data withheld to avoid disclosing data from individual farms.

— = data not available.

Source: Calculated by ERS using data from the 1992 *Census of Agriculture*.

1,016 per 1,000 farms with fatal injuries and 0.25 per 1,000 U.S. farms. Five States--Delaware, Indiana, Iowa, Minnesota, and Wisconsin--had higher operator and family member fatality rates per 1,000 farms than the U.S. average.<sup>1</sup> Texas' fatal injury rates to operators and family members were lower than the U.S. average.

There were 183 hired laborers fatally injured on 160 U.S. farms in 1992. This amounts to a rate of 1,144 per 1,000 farms with fatal injuries and 0.26 per 1,000 U.S. farms with labor expenditures. Six States--Arizona, California, Florida, Idaho, Louisiana, and Maryland--had hired labor fatality rates higher than the U.S. average (rates calculated per 1,000 farms with hired labor expenditures).<sup>2</sup> No State had fatal injury rates to hired laborers that were significantly lower (at the 95-percent confidence level) than the U.S. average.

## Nonfatal Farm Injuries

The general analysis of nonfatal farm injuries is less limited than that of fatal injuries. Data are available for comparing rates of injury for several categories of farms, and for all States for both operators and their family members, and hired laborers.

### Operators and Family Members

In 1992, there were 20,430 injuries to operators and their family members on 17,725 (less than 1 percent) of the 1,925,300 farms in the United States (table 2). This resulted in about 1,152.6 injuries per 1,000 farms where injuries occurred, and about 10.6 injuries per 1,000 U.S. farms (table 2). Since data were not collected on the number of family members working on farms, the analysis of injuries to operators and family members will be based on rates of injuries per 1,000 farms where injuries occurred, and rates of injuries per 1,000 U.S. farms. A comparison with the U.S. average determined levels of significance (at the 95-

percent confidence level) for rates of injury in each category, and rates for States.

### *Injuries per 1,000 Farms Where Injuries Occurred*

Based on an analysis of the data shown in table 2, only one type of farm (value of agricultural products sold amounting to \$500,000 and over) had a rate per 1,000 farms where injuries occurred that was significantly different (greater) from the U.S. average. No State rates were significantly different from the U.S. average (appendix table 1).

### *Injuries per 1,000 U.S. Farms*

All of the groupings of operators and farms had rates of injuries to operators and family members per 1,000 farms significantly different from the U.S. average, except vegetable and melon farms, poultry and egg farms, livestock specialty farms, other livestock farms, and farms located in the Corn Belt. The highest injury rates occurred on farms with \$500,000 or more in sales of agricultural products (table 2). Dairy farms had the next highest rate of injuries. Other notable rates per 1,000 farms within each grouping of farms (statistically different at the 95-percent level) are as follows:

- Occupation: Higher injury rates for farming as principal rather than secondary occupation.
- Age: Lower injury rates for operators 65 years and older and higher for those less than 44 years of age.
- Tenure: Lower rates for full owners and higher for part owners.
- Organization: Lower rates for individual or family organization types and higher for family-held corporations.
- Size of farm: Injury rates rise with size of farm: lower for farms with less than 100 acres and higher for farms with 1,000 acres and over.
- Sales: Injury rates rise with value of sales: lower for farms with sales amounting to less than \$20,000 and higher for farms with value of sales amounting to \$500,000 and over.
- Type of farm: Lower rates for fruit and tree nuts farms and higher for dairy farms.
- Region: Higher rates for farms located in the Lake States region.

While many of the regions' rates may be related to farm type, a clear relationship seems to emerge

<sup>1</sup> Data were not published for six States--Louisiana, Maryland, Massachusetts, New Jersey, New York, and Vermont. Each of these States contained two farms that had fatal injuries, except New Jersey, which contained one such farm.

<sup>2</sup> Data were not published for 18 States--Colorado, Indiana, Kansas, Michigan, Mississippi, Missouri, Nevada, New Jersey, New York, North Dakota, Oklahoma, South Carolina, South Dakota, Utah, Vermont, Virginia, West Virginia, and Wyoming. Nine of these States contained two farms and seven contained one farm where fatal injuries occurred to hired workers.

**Table 2—Nonfatal injuries to operators and family members on U.S. farms, 1992**

Item	Number of farms		Number of injuries			Percent

Sources: Calculated by ERS using data from the 1992 Census of Agriculture and Appendix table 1.

between the Lake States and dairy farms. Dairy farms, according to Census of Agriculture data, were more likely than the average U.S. farm to be operated by persons less than 25 years of age; to be run by part owners or partnerships; to have 500 to 999 acres; and to have sales of \$500,000 and over. Also, more than half of the U.S. dairy farms are located in the Lake States region. These farms require working closely with animals and machinery in an environment that includes wet floors that can become slippery (especially in winter), heavy lifting, and exposure to hay and animal dusts as well as to gasses from silos and manure (Murphy, Popendorf, Runyan, Von Essen, and Zwemer et al.). In addition, dairy farms are year-round rather than seasonal operations, resulting in more exposure to agents that cause injuries.

### **Hired Workers**

In 1992, there were 693,011 farms with hired labor expenditures, and injuries to hired workers were reported for 18,014 (about 3 percent) of these farms (table 3). The estimated total number of injuries to hired workers was 44,383, or about 2,464 injuries per 1,000 farms where injuries occurred, 64 injuries per 1,000 farms with hired labor expenditures, and 3.4 injuries per million dollars of hired labor expenditures (table 3). These injury rates are higher than the rate for operators and family members discussed above. However, many farms have more hired workers than operator and family workers and, therefore, a greater number of hired workers than operators and family members are exposed to injury on such farms. These results are similar to those reported in an earlier study by the National Safety Council (Hoskin et al., 1988).

The analysis of injuries to hired laborers will be based on rates of injuries per 1,000 farms where injuries occurred, rates of injuries per 1,000 U.S. farms, and rates per million dollars of hired labor expenditures. A comparison with the U.S. average determined levels of significance (at the 95-percent confidence level) for rates of injury in each category, and rates for States.

### ***Injuries per 1,000 Farms Where Injuries Occurred***

Two injury rates per 1,000 farms where injuries occurred stand out in the tables. First, in table 3, the rates on farms that were organized as "other" held corporations were 7,995.9 per 1,000 farms, or nearly 8 per farm. Second, in appendix table 2, the rates on

farms in Hawaii were 9,080.4 per 1,000 farms, or about 9 per farm. These rates indicate that some farms had large numbers of people injured.

### ***Injuries per 1,000 Farms Reporting Hired Labor Expenditures***

Based on an analysis of the data in table 3 concerning injuries per farm with hired-labor expenditures, 24 groups and 17 States had higher rates than the national average (table 3 and appendix table 2). Other-held corporations had the highest injury rate per farm with hired-labor expenditures, and farms with less than \$20,000 in sales had the lowest. These two groups also had the highest and lowest hired-labor expenditures per farm, respectively (table 4). The results of analyzing injury rates per 1,000 farms with hired labor expenditures within the broad groupings shown in table 3 (statistically different at the 95 percent level) are:

- Occupation: Higher injury rates for farming as principal rather than secondary occupation.
- Age: Lower injury rates on farms operated by those less than 25 years than by other age groups, and higher on farms operated by those 45 to 64 years of age.
- Tenure: Lower rates on farms operated by full owners, and higher on farms operated by tenants.
- Organization: Lower rates on farms organized as individual or family farms, and higher on farms organized as other-held corporations.
- Size of farm: Injury rates increase as size of farm increases: lower rates on farms with less than 219 acres in size, and higher on farms 1,000 acres and over in size.
- Sales: Injury rates increase as sales increase: lower rates on farms with sales amounting to less than \$20,000, and higher on farms with sales of \$500,000 and over.
- Type of farm: Lower rates on cash grain and tobacco farms, and higher on horticultural-specialty farms.
- Region: Lower rates on farms in the Northern Plains region, and higher on farms in the Pacific region.

### ***Injuries per Million Dollars of Labor Expenditures***

Another measure of injury rates for hired farm laborers is injuries per dollar of hired labor expenditures. In 1992 there were 3.4 injuries to hired laborers on

**Table 3—Nonfatal injuries to hired workers on U.S. farms, 1992**

Item	Number of farms			Number of injuries			Percent by group

continued--

farms per million dollars of hired labor expenditures (table 3).

Based on an analysis of these data, all but eight groups of operators and farms and eight States had different than U.S.-average rates of injuries per million dollars of hired expenditures. Twenty groups and 30 States had lower rates than the U.S. average and 17 groups and 14 States had higher rates than the U.S. average (table 3 and appendix table 2). The results of analyzing injury rates per million dollars of hired

labor expenditures within the groups of farms shown in table 3 (statistically different at the 95-percent level) are:

- Occupation: Injury rates were higher on farms with operators with primary occupations other than farming.
- Age: Lower rates on farms operated by those less than 25 years old.
- Tenure: Lower rates on farms operated by part owners, and higher rates on farms operated by full owners.

NA = not available.

\* Significantly different from the U.S. average at the 95-percent confidence level.

Sources: Calculated by ERS using data from the 1992 *Census of Agriculture* and Appendix table 4.

- **Organization:** Lower rates on farms organized as individual or family farms, and higher rates on other types of organizations.
- **Size of farm:** Higher rates for 1,000 acres and over.
- **Sales:** Lower rates on farms with sales of \$250,000 to \$499,999, and higher rates on farms with sales less than \$20,000. Distribution appears to be U-shaped.
- **Type of farm:** Lower rates on cash grain farms, and higher rates on animal specialty farms.
- **Region:** Lower rates on farms in the Delta and Northern Plains regions, and higher rates on farms in the Southeast region.

When analyzed by both injuries per farm reporting hired-labor expenditures and injuries per dollar of labor expenditures, a few groups were found to have comparable injury rates, either significantly higher or significantly lower than the U.S. average, under both categories. The less than 25 years-of-age group, individual or family-organization group, cash grain farms, and farms located in the Northern Plains were among

those having the lowest injury rates, while farms with 1,000 acres and over had the highest injury rates per 1,000 farms and per million dollars of labor expenditures.

Several groups of farms and States had injury rates per 1,000 farms where injuries occurred, per 1,000 farms that reported hired labor expenditures, and per million dollars labor expenditures that were different from the U.S. average. Ten groups had higher than the national average rates in all three categories (table 3):

- Family and other-held corporations,
- Other types of organizations,
- 1,000 acres and over,
- \$500,000+ in value of sales,
- Fruit and tree nut farms,
- Horticultural specialty farms,
- Other crop farms, and
- Farms located in the Southeast and Pacific regions.

These groups had higher than U.S. average labor expenditures per farm, indicating higher per farm

500 to 999 acres	98,545	2,170,673	22.0*	16.8
1,000 acres and over	115,131	5,236,860	45.4*	40.4

continued--

labor use, thus greater numbers of hired laborers exposed to situations that may cause injuries (table 4). The Southeast and Pacific regions also averaged more workers per farm than the U.S. average.

Rates higher than the national-average injury rates per 1,000 farms where injuries occurred, per 1,000 farms that reported hired labor expenditures, and per million dollars in labor expenditures that were different from the U.S. average also occurred in four States--California, Connecticut, Florida, and Hawaii. The number of workers on farms in these States was greater than the U.S. average (appendix table 2).

Twelve farm groups--individual or family, less than 100 acres, 220 to 499 acres, \$100,000 to \$249,999 value of sales, cash grains, tobacco, dairy, and farms located in the Appalachian, Delta, Corn Belt, Lake States, and Northern Plains regions--had lower than national average rates per 1,000 farms where injuries occurred, per 1,000 farms that reported hired labor

expenditures, and per million dollars labor expenditures (table 3). All of these groups except dairy had lower labor expenditures per farm than the U.S. average (table 4). The significantly lower than national average rates of injuries for hired labor on dairy farms contrast with the significantly higher than national-average rates of injuries for operators and families.

Rates lower than the national average in all three categories (rates per 1,000 farms where injuries occurred, rates per 1,000 farms that reported hired labor expenditures, and rates per million dollars labor expenditures) also occurred in 14 States--Arkansas, Illinois, Iowa, Kansas, Louisiana, Michigan, Minnesota, Missouri, North Carolina, North Dakota, Ohio, South Dakota, Tennessee, and Wisconsin (appendix table 2).

## Farm Safety Policy

Reducing the risk of injuries in farming may be accomplished by regulation, engineering, and educa-

tion, or a combination of these methods. However, the scope of each method is limited.

Farming presents unique problems for most safety regulations. Two Federal agencies, the U.S. Department of Labor and the U.S. Environmental Protection Agency, have regulations that affect farm safety. The U.S. Department of Labor administers both the Fair Labor Standards Act (FLSA), which has a child labor provision, and the Occupational Safety and Health Administration (OSHA). FLSA's child labor provision sets limits on the ages, hours, and conditions that children can be hired to perform farm work, but contains no protection for children of farm owners or operators when working on farms owned or operated by their parents. Safety regulations under OSHA apply to all employers, but Congress has

added riders to annual appropriations bills exempting farm operations that employ 10 or fewer employees and that do not maintain a labor camp. According to the 1992 Census of Agriculture, only 3 percent of all U.S. farms employed 10 or more workers, and about 56 percent of all hired workers on farms were employed on farms with 10 or more employees. Since these data indicate farms that employ 10 or more workers (as opposed to 11 or more in the OSHA regulations) and since they do not reveal how many farms employed 11 or more on a given day, OSHA regulations could apply to less than 3 percent of U.S. farms and cover less than 56 percent of hired workers on farms.

The U.S. Environmental Protection Agency (EPA) administers the Federal Insecticide, Fungicide, and

Rodenticide Act. In order to protect workers from pesticide poisoning, EPA promulgated the Worker Protection Standards (WPS), which contain provisions that apply to workers and to both employers of farmworkers and to non-employer owners and operators and their family members. Scientific research results about the effectiveness of WPS have not been reported.

Safety engineers and equipment designers have provided devices, warning labels, and equipment to attempt to reduce farm accidents resulting from using machinery. Since most machinery-related traumatic injuries involve farm tractors, engineering efforts have

focused on improving tractor safety, developing such tools as power take-off shields, warnings about moving parts and slow-moving vehicle signs, and roll-over protection. One of the problems with improving tractor safety is that tractors outlast their safety devices, warnings become hard to read, and innovations take years to become widely used (Murphy).

Education, properly planned and executed, holds great potential for improving farm safety. Farm safety education programs are most effective when operators, family members, farmworkers, manufacturers, researchers, and farm safety specialists are all involved in program development.

## Glossary

**Deaths:** Includes all deaths that resulted from injuries or accidents related to farm or ranch work on or for "this place." Deaths of family members, the operator, paid hired workers, and unpaid workers are included, but neither deaths of contract workers nor deaths that resulted from natural or accidental causes such as heart attacks, cancer, suicide, etc., are included.

**Farm Production Regions:** The States in Farm Production Regions are:

- Northeast--CT, DE, ME, MD, MA, NH, NJ, NY, PA, RI, VT;
- Appalachian--KY, NC, TN, VA, WV;
- Southeast--AL, FL, GA, SC;
- Delta--AR, LA, MS;
- Corn Belt--IL, IN, IA, MO, OH;
- Lake States--MI, MN, WI;
- Northern Plains--KS, NE, ND, SD;
- Southern Plains--OK, TX;
- Mountain--AZ, CO, ID, MT, NV, NM, UT, WY; and
- Pacific--AK, CA, HI, OR, WA.

**Injuries:** Includes all injuries resulting in lost work time or medical care expenses that occurred while doing farm or ranch work on or for "this place" during 1992. Injuries of family members, the operator, paid hired workers, and unpaid workers are included, but neither injuries to contract workers nor household injuries not related to the farming operation are included.

**Tenure of Operator:** The operators of the farms used in this analysis were either:

- Full owners--operated only land they owned.
- Part owners--operated land they owned and also land they rented from others.
- Tenants--operated only land they rented from others or worked on shares for others.

**Type of Farm:** The types of farms and their descriptions used in this analysis are:

- Cash grains--wheat, rice, soybeans, barley, buckwheat, cowpeas, dry field and seed beans and peas, flaxseed, lentils, mustard seed, oats, popcorn, rye, safflower, sorghum, and other small grains.
- Cotton and cottonseed.
- Tobacco.

- Vegetables and melons--grown in the open.
- Fruits and tree nuts--berries, grapes, tree nuts, citrus fruits, deciduous tree fruits, avocados, bananas, coffee, dates, figs, olives, pineapples, and tropical fruits.
- Horticultural specialties--bedding plants, bulbs, florists' greens, flower and vegetable seeds, flowers, foliage, fruit stocks, nursery stock, ornamental plants, shrubbery, sod, mushrooms, and vegetables grown under cover.
- Other crops--sugar cane, sugar beets, Irish potatoes, alfalfa, broomcorn, clover, grass seed, hay, hops, mint, peanuts, sweet potatoes, timothy, yams, and other crops (including horticultural specialties) but less than 50 percent of the total value of sales from any single industry group.
- Beef, hogs, and sheep--cattle, calves, hogs, sheep, goats, goats' milk, mohair, and wool.
- Dairy farms--production of cows' milk and other dairy products and raising of dairy heifer replacements.
- Poultry and eggs--chickens, chicken eggs, turkeys, ducks, geese, pheasants, pigeons, quail, and squab.
- Animal specialties--fur-bearing animals, rabbits, horses, ponies, bees, fish in captivity except fish hatcheries, worms, and laboratory animals.
- Other livestock--livestock and animal specialties and their products, but less than 50 percent of sales from any single industry group.

**Types of Organizations:** Based on the individual(s) or group governing the farm's legal and financial decisions:

- Individual or family operation--controlled and operated by an individual (sole proprietorship). Includes family operations that are not incorporated and not operated under a partnership agreement.
- Partnership operation--two or more persons who have agreed on the amount of their contribution (capital and labor) and the distribution of profits.
- Corporate operations--a legal entity or artificial person created under the laws of a State to carry on a business. Includes both family held (more than 50 percent of the stock is owned by persons related by blood or marriage) and other-held corporations.
- Other organizations--cooperatives (defined as an incorporated or unincorporated enterprise or an association created and formed jointly by the members), estate or trust (defined as a fund of money or property administered for the benefit of another

individual or organization), prison farm, grazing association, Indian reservation, institution run by a government or religious entity, etc.

**Appendix table 1—Nonfatal injuries to operators and family members on U. S. farms by State, 1992**
