	PAGE
1 Powered equipment: estimated performance rate, life annual use, purchase price, repair cost, fuel use, and direct and fixed costs per hour and per acre, Louisiana, 1997	E-36
2 Towed equipment: estimated performance rate, life, annual use, purchase price, repair cost, fuel use, and direct and fixed costs per hour and per acre, Louisiana, 1997	E-37-E-38
3 Durable inputs: estimated fuel use, repair cost, labor use, depreciation, and interest on investment, Louisiana, 1997	E-39
4 Operating inputs: estimated prices, Louisiana, 1997	E-40
5 Summary of estimated costs per acre, overhead costs, owner-operators, Louisiana, 1997	E-41
6 Summary of estimated costs per acre, overhead costs, tenant-operators, Louisiana, 1997	E-42

ACKNOWLEDGEMENTS

The authors are indebted to the many persons instrumental in making this report possible: Parish Agricultural Extension Agents for cooperation and assistance in locating farmers; Farm suppliers and agribusiness firms for supplying price information; Farmers for providing the survey information; Departmental Farm Management Committee; Robert Boucher and Grant Giesler for collecting and coding input price data; David Lavergne for developing spreadsheet templets; State Extension Service personnel for assistance in preparation of this report.

COTTON, SOYBEANS, CORN, MILO AND WHEAT,
RED RIVER AND CENTRAL AREAS, LOUISIANA, 1997**

by

Kenneth W. Paxton¹

ENTERPRISE BUDGETS

The enterprise budgets for owner-operators and tenant-operators are presented in two formats. One format is a summary of costs and returns for the enterprise. This format presents costs by broad categories such as herbicides, insecticides, etc. The other format presents a detailed listing of the operations, the equipment size and the associated power unit along with the date performed and the associated costs for tractor, machinery and materials. Together these formats provide the detailed information necessary to adjust budgets to individual situations. In addition, the appendix to this report contains detailed cost estimates for an extensive list of equipment, irrigation systems, and operating inputs. These may also be used to modify budgets contained in this report or construct new enterprise budgets.

It should also be noted that the enterprise budgets presented for owner-operators assume the operator owns the land resource (i.e. he has 100 percent equity in the land). If a person is in the process of purchasing his land (less than 100% equity) his cost of production may be considerably higher than the full owner or the tenant-operator. For example, if a farmer pays a land note of \$100 per acre per year, he may have a higher cost per unit of output than a person renting the land. To account for land costs in the owner-operator budgets, an opportunity cost for land is shown as an allocated cost item in the budgets. These are non-cash costs that represent income that could be gained if the owner-operator choose to rent out the land rather than produce the enterprise.

Cotton Budgets

This report presents cotton budgets showing projected costs and returns for 1997 for the Red River and Central Areas of Louisiana. Cotton budgets are presented for 6- and 8-row equipment. A 38 inch row spacing was used as a basis for all equipment size designation. Budgets are presented for both solid and skip-row planting patterns. Both owner-operators and tenant-operators budgets are presented in this report. Following each budget is a table showing the sequence of operations and associated machinery costs and labor requirements for each operation.

Cotton Harvesting

Harvesting costs shown in the budgets are based on using four-row cotton pickers. Data on costs associated with owning and operating two-row cotton pickers are shown in the appendix to this report. These data indicate that the cost of owning and operating a two-row picker are approximately \$55.00 per acre compared to \$40.38 for a four-row picker. These costs assume that the four-row machine will be used on approximately 770 acres while the two-row machine will be used on 345 acres. Rates of use higher (lower) than these will decrease (increase) per acre costs. Enterprise budgets reflect twice over harvest for approximately half of the acreage. The decision to "scrap" cotton should be based on the potential profitability of the operation comparing the value of the cotton harvested with the cost of operating the cotton picker and associated equipment.

Professor, Department of Agricultural Economics and Agribusiness, Louisiana Agricultural Experiment Station, Louisiana State University Agricultural Center, Baton Rouge.

Soybean Budgets

Budgets showing projected costs and returns for soybeans for 1997 are presented for the Red River and Central Areas. Budgets are presented for two soil types (sandy and clay) and equipment sizes (6- and 8-row). All equipment size designations are based on a 38 inch row width. Many soybean producers employ production techniques which utilize a row spacing of less than 38 inches. However, the 38 inch spacing was the dominant spacing on the survey farms and all budgets for conventionally planted soybeans were based on this spacing. A budget is also presented for soybeans planted with a grain drill.

Corn, Milo and Wheat Budgets

Budgets showing projected costs and returns for corn, milo and wheat for 1997 are presented for the Red River and Central Areas. Following each budget is a table showing the operations and associated costs for each operation. Corn, milo, and wheat budgets showing projected costs for 1997 are presented for one equipment size (6-row). Since wheat is generally produced in a double crop situation, a charge for farm overhead is not included in the wheat budget.

SUMMARY

A summary of projected costs and returns for cotton production situations included in this report is presented in Table 1. There is a slight advantage for the larger size equipment in terms of net returns and total costs. Cotton production costs for 1997 include the use of a module builder for a portion of the cotton harvested. A mandatory checkoff charge of \$2.31 per bale was included in the 1997 cotton budgets. This charge was based on a flat charge of one dollar per bale plus 0.5 percent of the loan value of a 480 pound bale. A summary of breakeven selling prices necessary to recover direct expenses as well as total costs are shown in Table 2. Breakeven selling prices are shown for five yield levels.

A summary of projected costs and returns for soybean production situations included in this report is presented in Table 3. Budgets are presented for two soil types (sandy and clay) and two equipment sizes (6- and 8-row). Within soil types, larger sized equipment had an advantage over smaller size equipment. There was little difference in net returns for soybeans produced on sandy soils and soybeans produced on clay soils. Table 4 presents breakeven selling prices for soybeans at five yield levels for the budget situations presented.

Table 5 presents a summary of projected costs and returns for corn, milo, and wheat budgets included in this report (wheat budgets do not include a charge for farm overhead since wheat is generally produced as a double crop (e.g. wheat, soybeans). Breakeven selling prices for corn, milo and wheat at five yield levels are presented in Table 6.

"Breakeven" selling prices have been included in this report for five production levels for each crop situation budgeted. The breakeven selling price represents the cost per unit of output at that particular yield level. Thus, a price higher than the breakeven price would have to be received before the operator would receive a return above the specified costs. "Breakeven" prices have been presented for "direct expenses" (a close approximation of cash costs for most producers) and for "total specified expenses", which represents all costs except overhead, land, and risk costs for the business. Therefore, owner-operators would need a price above the total specified breakeven cost before a return to land would be incurred. For example, if the breakeven selling price above total specified expenses for soybeans at a yield of 25 bushels per acre is \$4.50 and the expected selling price is \$5.50 per bushel, then the producer could expect \$1.00 per bushel or \$25.00 returns per acre to land and risk. "Breakeven" prices for "direct expenses" do include land rent for tenant-operators. If land rent was entered as a cash rent in tenant budgets, the "breakeven" price for total specified direct expenses would include land as a charge in those situations.

TABLE 1. A summary of projected costs and returns per acre for Cotton production, Red River and Central Areas, Louisiana, 1997.^A

Crop Description	Yield Per Acre ^B	Unit	Returns					
			Total Income	Direct Expenses	Above Direct Expenses	Total Fixed Expenses	Total Specified Expenses	Above Specified Expenses
.....Dollars per unit.....								
Cotton, 6-row, solid	700	lbs. of Lint	526.88	402.66	124.22	71.80	474.46	52.43
