FOREWORD

ion programs to deal with the farm conditions has increased the need for farm wage rates and employment. Economics, as well as other agencies in the past collected and published a large amount of data dealing with these subjects. To make available to the public the studies and publications more readily accessible, significant data have been pulled together and presented in a condensed form primarily to provide a handbook of readily usable data in a readily usable form from the pertinent data collected through a large number of publications.

The first three sections include detailed wage rates and employment data. The last section, beginning on page 174, is devoted to broad comparisons of agricultural income, the farm wage bill, industrial wage rates, and related information.

The sources of individual tables are indicated. The work of assembling these materials was done by a committee including the following members of the BAE staff: E. M. Brooks, L. J. Ducoff, C. A. Gibbons, and Wylie D. Goodsell.

TABLE OF CONTENTS

	Page
A. Introduction	1
B. Farm wage rates and index numbers:	
Annual farm wage rates and index numbers, United States, 1866-1942 (class and composite)	3
Annual farm wage rates and index numbers, geographic division, 1910-42 (class and composite)	5
Annual farm wage rates, by States, 1866-1922 (class)	14
Quarterly farm wage rates and index numbers, United States, Jan. 1923 - Oct. 1942 (class and composite)	38
Quarterly farm wage rates and index numbers, geographic divisions, Jan. 1923-Oct. 1942 (class and composite)	41
Quarterly farm wage rates, by States, Jan. 1923-Oct. 1942 (class)	59
Quarterly farm wage rates, by States, Jan. 1939-Oct. 1942 (composite)	139
Farm wage rates, by States, and index numbers for geographic divisions, Mar. 1, 1942 (class)	141
Farm wage rates, by States, and index numbers for geographic divisions, June 1, 1942 (class)	142
C. Piece-work rates:	
Average rates for picking 100 pounds of seed cotton, by States, 1924-42	143
Piece-work rates paid hired farm workers for specified jobs, by States (1934 and 1942)	144
Threshing and combine harvesting costs, by States: Wheat, oats, and barley in 1934, and wheat, oats, and corn in 1938	148
Sugar beet and sugarcane wage rates set by the Secretary of Agriculture, 1939-42	150
D. Farm employment (family workers, hired workers, and total)	
Annual average employment and index numbers, United States, 1909-42	155
First-of-month employment, United States, 1925 to date	156
First-of-month employment, geographic divisions, 1934 to date	158
First-of-month employment, by States, April, May, and June, 1942	167

TABLE OF CONTENTS

	Page
D. Farm employment (continued)	
Monthly index numbers, United States, unadjusted and adjusted for seasonal variation, 1925-42	168
Seasonal variation in farm employment, United States, 1925-36	172
Bureau of the Census estimates of the labor force, employment and unemployment, April 1940 to Nov. 1942	173
E. Farm income, farm wage bill, industrial wage rates, and related data:	
Cash wage bill and cost of perquisites by residence of laborers, and total farm labor bill, United States, 1910-42 (including chart)	174
Cash farm income, 1939-41, and cash wages paid hired farm labor, by States, 1939	176
Net income of farm operators and comparison with farm wage bill, United States, 1910-42	177
Net income and payments to hired labor, typical family-operated farms, United States, 1910-42 (including charts)	178
Average wage income of agricultural and industrial workers, and index numbers, United States, 1910-42 (including chart)	186
Hourly earnings of factory workers, wage income per industrial worker, and wage income per hired farm worker, United States, 1910-42 (including chart)	188
Hourly earnings of factory workers, by months, United States, 1929-42	190
Average hourly entrance rates for common labor in industry groups and road building, various dates and areas, 1926 to 1942	191

FARM WAGE RATES, EMPLOYMENT, AND RELATED DATA

Sources of wage rate data

In 1912, the results of a number of inquiries into the average wage rates paid to farm labor were published as a bulletin of the Department. A digest of these investigations appears in the July 1925 issue of Crops and Markets:

"Nineteen investigations ... were made in the forty-four year period beginning with 1866 and ending with 1909. The first of the investigations, made in 1866, is believed to be the first attempt to make a scientifically established average of wage rates, either for farm labor or for any other kind of labor. The source of information was the corps of crop correspondents. The second investigation was made in December 1869, and covered that calendar year. For some unexplained reason the third inquiry, of 1875, was made in May, and all succeeding ones were made in the spring until 1892. Subsequent investigations were made in the autumn or winter.

"From 1909 to 1923, the Department of Agriculture made an annual inquiry regarding farm wages. The regular crop reporters were used for this purpose. Beginning with 1923, the inquiry has been made quarterly on the first of January, April, July, and October.

"During the period when the investigations were made in the spring, the year to which the results apply is somewhat uncertain. On account of this uncertainty a dual form of expression is used, such as 1874 or 1875. The records of wage rates per day are comparable for the entire period from 1866 to 1923, and were formerly designated as 'other than harvest work.' The records of monthly wage rates are not entirely comparable. Wage rates per month when hiring was done by the year are used from 1866 to 1890. The record since 1891 shows no such distinction as hiring by the year or season. 1/"

A further discussion of farm wage rates subsequent to 1912 appeared in the same issue:

"In 1923, the inquiry on farm wages was first made quarterly-- the first of the month in January, April, July, and October. The regular annual inquiry was made in December 1923, for the purpose of linking the quarterly inquiry with the annual inquiry. In the annual inquiry day wages were asked in two ways, 'at harvest' and 'other than harvest labor.' The quarterly inquiry asks for the 'average wages being paid to hired labor at the present time in your locality.' Day wages are expected to include 'average daily earnings of piece-workers' as well. The quarterly type of inquiry automatically eliminates the distinction between harvest and other than harvest labor. A careful study of the 1923 overlapping inquiries on a quarterly

1/ A detailed description of the wages prior to 1909 will be found in Bulletin 99, U. S. Department of Agriculture, Bureau of Statistics, by George K. Holmes, issued November 7, 1912.

and annual basis indicates that for comparative purposes the 'other than harvest' wage rates are really more nearly comparable with the quarterly rates than any combination of 'at harvest' and 'other than harvest' rates might be." 2/

Consequently, the "other than harvest" rates have been used to represent wage rates per day for the years 1909-22.

Methods of weighting wage rates

Three types of weighting are involved in securing the various average wage rates included in this publication. These are (1) the weighting of individual State rates to obtain geographic division and United States rates, (2) the weighting of class rates to derive a composite rate representing the four classes of payment combined -- per month with and without board and per day with and without board, and (3) the weighting of quarterly rates to obtain annual rates.

1. The numbers of hired farm workers are used in weighting State wage rates to obtain rates for geographic divisions and the United States. Before 1939, only male hired farm workers are included in the employment figures used for weighting. Employment data from the Censuses of Occupations are the basis for weights for the period 1866 to 1906. The 1910 and 1920 Censuses of Agriculture furnish the basis for weights used for the period 1909 to 1922. With quarterly wage rates available beginning in January 1923, it was necessary to use comparable employment figures in weighting. Since that time weighting has been based on information of monthly numbers of hired farm workers, collected by the Department of Agriculture.

Some variations occurred in the method of weighting currently published wage rates for this period but the official estimates of wage rates now in use were prepared in 1938 and maintained currently thereafter. Individual State rates are the same as those published currently at the time to which they refer, but historic geographic division and United States rates were reweighted in 1938 on the basis of employment estimates obtained in a study made at that time as part of the W.P.A. National Research Project. 3/ This study resulted in monthly estimates of the number of hired workers for the period 1925 to 1936, which were combined to obtain quarterly employment weights for those years. The seasonal variation shown by the employment figures for 1925-36 was used in adjusting annual averages of employment to give quarterly employment weights for 1923 and 1924. At the same time the Bureau revised its currently published monthly employment estimates for 1937 and 1938 and brought the series of quarterly weights up to date in 1938. Since 1939 current monthly estimates of hired farm workers are the basis for weighting quarterly wage rates. The October 1, 1942 rate, for example, is weighted by numbers of hired workers employed on October 1, rather than the sum for September 1, October 1, and November 1, although the latter sum is used in weighting quarterly rates to obtain annual rates. No general revisions of the wage rate series have been made since 1938.

2. In combining the rates shown for the four methods of payment to obtain the composite rates, estimates of numbers of workers receiving each type of payment are used in weighting. These numbers are obtained by applying geographic division figures on percentage of workers receiving each type of payment to the total number

(Cont'd on page 15)

2/ This was the conclusion reached by Joseph A. Becker and Charles F. Sarle when the wage rate index of the Department was established, Crops and Markets, Vol. 2, Supp. 7, page 216, July 1925.

3/ Trends in Employment in Agriculture, 1909-36, Eldon E. Shaw and John A. Hopkins, Works Progress Admin., Natl. Res. Project, Report No. A-8, Phila., Pa., November 1938.

1/ Annual farm wage rates from 1866 to 1922 are U. S. averages of reports by crop reporters, giving average wage rates for the year in their localities.

2/ Years 1866 to 1878 in gold.

3/ 1877 or 1878, 1878 or 1879 (combined).

4/ Annual farm wage rates for 1923 and following years are averages of quarterly rates obtained from crop reporters, giving current wage rates prevailing in their localities.

5/ Revised.

1/ Annual farm wage rates from 1910 to 1922 are geographic division averages of reports by crop reporters, giving average wage rates for the year in their localities.

2/ Annual farm wage rates for 1923 and following years are averages of quarterly rates obtained from crop reporters, giving current wage rates prevailing in their localities.

3/ Revised.

Footnotes page 19.

of hired workers employed in each geographic division on the date to which the wage rates apply. The day rates are multiplied by 20 to make them equivalent to the monthly rates. A constant set of percentages has been used in weighting each geographic division for the years 1925 to date. These are based on a survey made in 1927 to determine the number of workers receiving each type of payment. Since information on numbers of workers receiving each type of payment is not available by States, the State composite wage rates shown on pages 139 and 140 are based on the assumption that the same distribution in type of payment prevails for all States in a division.

3. Quarterly wage rates since 1923 were combined to obtain annual wage rates. As both the employment and wage data were for the 1st (not the 15th) of the month, it was necessary to weight the wage rates by the employment data in such a way as to center the resulting total on an exact calendar year. Thus, for each year the April 1 composite wage rate was multiplied by the sum of the employment estimates for March 1, April 1, and May 1; the July 1 rate by the sum for June 1, July 1, and August 1; the October 1 rate by the sum for September 1, October 1, and November 1; the January 1 rate for the current year by employment on February 1 plus one-half the employment on January 1; and the January 1 rate for the following year by employment on December 1 of the given year plus one-half the employment on January 1 of the next year.

The quarterly class weights used in obtaining annual class rates are the corresponding sums of numbers of hired workers receiving each of the four types of payment.

Piece-work rates are weighted by the appropriate production weights to obtain geographic division and United States averages.

For a discussion of the dependability of farm wage rate data see "Reliability and Adequacy of Farm Wage Rate Data," by R. F. Hale and R. L. Gastineau, A.M.S., 1940.

Farm-Employment Data

Monthly estimates of the numbers of family workers, hired workers, and total farm employment for the United States are available for the period 1925 to date, and for geographic divisions, from 1934 to date. For individual States, rough approximations have been made for use in arriving at geographic division estimates. These figures are also used in weighting wage rates as explained above. Official State estimates of farm employment are available only for the months of April, May, and June, 1942, when crop reporters' data were supplemented by special farm labor survey indications. The United States and geographic division estimates are based on monthly returns from crop reporters, adjusted to census levels. Crop Reporters have been circularized monthly since October 1923 for farm-employment information. Agricultural census data of 1920, 1930, and 1940 were used in adjusting crop reporters' monthly indications for the period 1925 to date.

As employment data from crop reporters were not collected during most of the period 1909 to 1924, monthly estimates are not available for that period. However, annual estimates have been prepared on the basis of census data and such factors as acreage and production of crops, numbers of livestock, and farm population changes.

Employment estimates include all persons employed on farms 2 or more days during the week just prior to the inquiry, excluding persons doing housework. Family workers include the operator and members of his family who are not paid wages. Hired workers include all persons paid wages for farm work, whether by month, day or piece work.

^{1/}Annual farm wage rates are averages of reports by crop reporters, giving average wage rates for the year in their localities.

^{2/}Years 1866 to 1878 in gold.

^{3/}1877 or 1878, 1878 or 1879 (combined).

^{4/}For 1909 and following years, rates for U.S. are revised rates.

A great deal of seasonal variation occurs in the numbers of persons employed on farms. This is true of both classes of workers, as is indicated in the charts on page 172 which cover the period 1925-36. These charts show first-of-the-month employment as percentages of a centered 12-month moving average. There is reason to believe that the samples obtained do not fully reflect these seasonal patterns because (1) the sample of crop reporters' farms includes a disproportionate number of larger-than-average farms, (2) these farms carry on a more stable type of farm operations, and (3) some reporters may report only full-time workers and omit all or part of the seasonal workers. Sample averages per farm for hired and family workers are adjusted to the census levels by interpolations between census periods and by extrapolations beyond the last census date. The adjusted averages per farm are multiplied by the estimated number of full-time farms in each State (that is, those on which the operator worked less than 250 days off the farm during the year). Data from the Federal Census, State assessors' reports, and A.A.A. records are used in preparing the estimates of numbers of farms.

In 1938, Shaw and Hopkins (see footnote, page) published farm-employment estimates for the period 1909-1936. These were annual estimates from 1909 to 1924 and monthly beginning in 1925. Monthly estimates of farm employment have been made currently by the Bureau of Agricultural Economics since January 1939. In April 1942, when 1940 Census data were available, revisions were made back to January 1935. The wage data for this period; however, were not reweighted.

Indexes of Farm Wage Rates and Farm Employment

Indexes of farm wage rates and farm employment are based on the period 1910-14. The base in each case is a straight average of five annual figures. The wage rate

index reflects the level of the weighted average or composite wage rate. The quarterly wage rate index is adjusted to remove seasonal variation, which normally accounts for a rise of about 7 percent from the low winter level to the high summer and fall levels. Adjustment factors for the entire series are based on the average relationship of the quarterly averages to the annual averages during the 16 years from 1923 to 1939. They are as follows: January, 96%; April, 98%; July, 103%; October, 103%. The quarterly unadjusted index is divided by the corresponding adjustment factor to obtain the adjusted index.

Monthly adjustment factors are used to adjust the monthly employment indexes for seasonal variation. Employment data, unlike wage rate data, show trends in seasonality. Hence it is necessary to bring the adjustment factors up to date each year in the light of the previous year's experience. A different set of factors is, of course, used for family workers and hired workers.

Total Farm Labor Bill

Estimates of the farm labor bill shown on page 174 were made by considering separately three component parts - the cash wage bill, the cost of board and lodging, and the cost of other perquisites. For 1909, 1919, 1929, and 1939 the figures for cash wages are unadjusted totals from the Census of Agriculture. Estimates of the cash wage bill for other years were interpolated and extrapolated by means of an index number series representing the product of farm wage rates and farm employment.

The estimates of the cost of board and lodging for 1909 and 1919 are Census of Agriculture totals. For other years estimates were obtained from percentage changes in the product of employment with board and the difference between average wage rates with and without board, this difference being taken as representing the average cost of board and lodging. An estimate of the cost of perquisites other than board and lodging for the year 1925 was derived from data in U.S. Department

of Agriculture Technical Bulletin 213. 4/ Estimates for other years were obtained by using an index number series showing changes in employment of hired farm laborers and changes in farm prices of the more important perquisite items.

A detailed statement of the methods used in estimating the farm labor bill was published in April 1939 as Part II, Section 1 of the series on Income Parity for Agriculture, "The Cost of Hired Farm Labor, 1909-38." The break-down of the farm labor bill according to the residence of the laborers is necessary in order to compute the net income from farming of individuals living on farms, as required by the Agricultural Adjustment Act of 1938.

Farm Income

Except for data relative to typical family-operated farms, appearing on pages 178-185a, the statistics of farm income shown in this publication are taken from regularly published reports of the Bureau. The estimates of net income of farm operators, net income of persons on farms, and income of agricultural workers are shown in more detail in "Net Farm Income and Income Parity Summary, 1910-41," published July 1942. Attention is called to the differences between various measures of farm income. Cash farm income represents gross cash receipts of the farm business. Net income of farm operators does not represent net cash returns to the farm operators but is an accounting concept representing cash farm income plus the value of home consumption of food and fuel plus the net rental value of farm residences plus the value of physical changes in inventories of farm live-stock and crops for sale minus all production expenses, including depreciation charges. The net income of persons on farms is the sum of the net income of farm operators and wages and perquisites paid to farm laborers living on farms.

^{1/} Annual farm wage rates are averages of reports by crop reporters, giving average wage rates for the year in their localities.

^{2/} Years 1866 to 1878 in gold.

^{3/} 1877 or 1878, 1878 or 1879 (combined).

^{4/} For 1909 and following years rates for U.S. are revised rates.

The income of agricultural workers is the sum of the total farm labor bill and the net income of farm operators minus the value of inventory changes. The value of inventory changes is omitted in order to put this item on a realized basis instead of an accrued basis.

Comparison of Income and Wages of
Agricultural and Industrial Workers

The table on page 186 and the chart on page 187 show the average yearly incomes of industrial workers and of persons engaged in agriculture. The figures for industrial workers were computed by dividing annual wage payments to employees of factories, mines, and railroads by the average number of such employees each year. In the case of agriculture, the majority of the workers are not hired and do not receive wages. The reward for their labor is included, along with returns for the use of capital and for management, in the net income of farm operators. The average yearly income of agricultural workers was computed by adding wages and perquisites paid to hired laborers to the net income of farm operators and dividing the sum by the average farm employment. The average incomes of industrial workers and of agricultural workers are not comparable because the latter contain some returns for management and for the use of farm capital, but a comparison of the long-time trends in the two series is significant. Average annual wage income per hired farm worker (including the value of perquisites) from 1910-1942 is shown on page 188. These data are compared with average wage incomes of industrial workers and with hourly earnings of factory workers. Additional data on hourly earnings of factory workers are presented by months from 1929-1942 on page 190. These figures represent average earnings of skilled and unskilled workers in manufacturing industries. The available information on common labor wage rates in industry are summarized on pages 191-193.

^{1/} Annual farm wage rates are averages of reports by crop reporters, giving average wage rates for the year in their localities.

^{2/} Years 1866 to 1878 in gold.

^{3/} 1877 or 1878, 1878 or 1879 (combined).

^{4/} For 1909 and following years, rates for U.S. are revised rates.

^{1/}Annual farm wage rates are averages of reports by crop reporters, giving average wage rates for the year in their localities.

^{2/}Years 1866 to 1878 in gold.

^{3/}1877 or 1878, 1878 or 1879 (combined).

^{4/}For 1909 and following years, rates for U.S. are revised rates.

1/ Wage rates for 1939 and 1940 were the same as in 1941 except where otherwise noted.

2/ The more common rate in this area is a combined rate per acre for blocking, thinning, and hoeing of \$13.50 in 1942 and \$11.00 in 1941.

3/ The more common rate in this area is a combined rate per acre for blocking, thinning, and hoeing, the rates varying with the cultivation method used. The 1942 rates per acre are: "Old method" or "hill drop" fields \$14.50; "Blocked" fields \$12.50; "Cross cultivated" fields \$11.50. The 1941 combined rates per acre were: "Old method" or "hill drop" fields \$12.00; "Blocked" fields \$10.50; "Cross cultivated" fields \$9.50.

4/ In 1940 hoeing was \$2.00 per acre for the first hoeing and \$1.00 per acre for each subsequent hoeing.

Footnotes on page 152 a.

Continued

- 1/ Harvest rates for 1939 and 1940 were the same as in 1941.
- 2/ Rates include topping and loading. When loading is performed by a person other than the one doing the topping 30 percent of the above rates is to be paid for loading.
- 3/ Rates include topping and loading.
- 4/ If loading is performed by a person other than the one doing the topping, the rate for loading is 20 cents per ton and the topping rate is \$1.05 per ton up to and including 12 tons plus \$0.95 for each ton above 12.
- 5/ The sliding scale of rates for the first two areas continues up to 25 tons, after which the rate remains fixed at the 25-ton rate.

Sugarcane wage rate sets by the Secretary of Agriculture
for Louisiana and Florida 1941 and 1942 crops

NON-HARVEST OPERATIONS					
State and operation	1942		1941		Per hour
	Per 9- hour day	Per hour	Per 9- hour day	Per hour	
	Dollars	Cents	Dollars	Cents

^{1/}These estimates prepared by the Bureau of the Census are included for comparison with Dept. of Agriculture data. Differences between agricultural employment totals shown here and those on page 157 are partly explained by lack of comparability in definitions. For example, the Bureau of the Census includes as employed, persons 14 years of age or over who worked in the reported week a greater number of hours in agriculture than in any other occupation. The Department of Agriculture estimates include persons of all ages who worked in the reported week 2 or more days at farm work.

^{2/}Excludes institutional population and estimated number of persons in the armed forces. ^{3/}Not available. ^{4/}Preliminary--subject to revision.

1/ Includes Government payments since 1935.

2/ Cash wages and value of board, lodging and other perquisites.

3/ Preliminary.

Farm Income and Payments to Hired Labor - Typical Family-operated Farms,
United States, 1910-42

The income information for typical farms in the attached tables is representative of typical family-operated farms in some of the major farming regions throughout the country. They represent farms that furnish rather full employment to a farmer and members of his family during the year. Some labor is hired during peak seasons. The total hours of man labor utilized on these farms range from approximately 3,700 hours on cotton farms to about 7,000 hours on some of the livestock farms.

The Corn Belt farms are typical of a large number of farms in the Corn Belt States. Hog-dairy farms average about 135 acres in size, cash-grain farms 220 acres, and hog-beef breeding fattening farms 200 acres in size. The major source of income on cash-grain farms is from the sale of corn, oats and soybeans, whereas the major source of income on hog-beef and hog-dairy farms is from the sale of hogs and beef and hogs and dairy products respectively. Operators of the latter two types of farms usually buy some feeds.

Winter wheat farms in the Southern Great Plains average between 500 and 600 acres in size and the major source of income is from the sale of wheat. Income from livestock enterprises amounts to only 40 percent of the total income on wheat-corn-livestock farms and to 30 and 8 percent, respectively, on wheat-grain-sorghum-livestock and wheat farms.

The Wisconsin dairy farms are typical of dairy farms in southern Wisconsin that produce milk for processing. They are farms with about 115 acres of which about 85 acres are cropped. The average milking herd is about 17 cows which contribute about 73 percent of the income. The New York dairy farms on the other hand have about 50 acres in crops and 17 cows and produce market milk. Over 80 percent of the income is from the dairy herd. Practically all the concentrate feeds are purchased on the New York farms.

The 2-mule cotton farms in Georgia have about 40 acres in crops, and slightly less than 12 acres in cotton. The 2-mule cotton farms in the Mississippi Delta are slightly smaller than the 2-mule cotton farms in Georgia but they have slightly more acreage in cotton and about twice the yield per acre, particularly in recent years. About 80 percent of the total farm income is from the sale of cotton on the 2-mule Mississippi Delta cotton farms as compared to less than 60 for the 2-mule Georgia cotton farms. The typical cotton farms in the Black Waxey Area of Texas have about 100 acres in crops, of which approximately 38 are in cotton. About 60 percent of the income is from the sale of cotton.

The two types of tobacco farms differ little except for the acreage and type of tobacco produced. Typical flue-cured tobacco farms have about 7.5 acres in tobacco as compared to about 5 acres for the typical fire-cured tobacco farms. Over 80 percent of the gross farm income is from the sale of tobacco on flue-cured tobacco farms as compared to about 55 percent on fire-cured tobacco farms.

Purchasing power of net farm income of typical commercial family operated farms
